GAM NAME	TARGET	GAM RNA SEQUENCE	GAM FUNCTION	GAM TAR POS	DIS
GAM25	IGF1	AATTGCTTGAACCCA GGAAGTG	Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is a GAM25 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM25 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

A function of GAM25 is therefore inhibition of IGF1, a GAM25 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 has been established by previous studies. By the solid- phase method, Li et al. (1983) synthesized human somatomedin C, which has 70 amino acid residues and 3 disulfide bridges. Using cDNA probes in the analysis of somatic cell hybrids, Brissenden et al. (1984) and Tricoli et al. (1984) independently assigned the IGF1 structural gene to chromosome 12. Tricoli et al. (1984) regionalized the locus tentatively to 12q22- qter, where the KRAS2 (OMIM Ref. No. 190070) gene is situated. This proximity, as well as that of the HRAS1 (OMIM Ref. No. 190020) and IGF2 (OMIM Ref. No. 147470) genes on 11p and that of the NRAS (OMIM Ref. No. 164790) and NGFB (OMIM Ref. No. 162030) genes in band 1p22, suggested to Brissenden et al. (1984) that a functional or evolutionary relationship may exist between members of the RAS family of protooncogenes and growth factor genes. Chromosomal abnormalities in the region of these genes have been associated with specific forms of neoplasia. Both IGF1 and IGF2 have a striking structural homology to proinsulin. Deficiency of IGF1 was proposed as the nature of the basic defect in the African pygmy (OMIM Ref. No. 265850) and possibly also in the Laron type of dwarfism (OMIM Ref. No. 262500). The homology of chromosomes 11 and 12 is supported by the finding of yet another pair of structurally homologous loci on these 2 chromosomes. See 146000 for description of the work of Mullis et al. (1991) suggesting that the IGF1 gene may be the site of the mutation causing one form of hypochondroplasia. Using stored sera from men followed in the Baltimore Longitudinal Study on Aging, Harman et al. (2000) investigated whether the circulating IGF1 level is an independent predictor of prostate cancer and compared its predictive value with those of IGF2, IGFBP3, and prostate- specific antigen (PSA; 176820). High IGF1 and low IGF2 were independently associated with increased risk for prostate cancer, but PSA level was a much stronger predictor of prostate cancer than either IGF1 or IGF2. The absence

of a relationship of IGF1 to prostate size is inconsistent with increased ascertainment in men with large prostates as the source of greater prostate cancer risk associated with IGF1. The authors concluded that IGF2 may inhibit both prostate growth and development of prostate cancer. Low birthweight is associated with later risk of type 2 diabetes and related disorders. Vaessen et al. (2002) studied the relationship between low birthweight and a polymorphism in the IGF1 gene that raises risk of type 2 diabetes and myocardial infarction. They recorded birthweight and obtained DNA for 463 adults. Individuals who did not have the wildtype allele of the polymorphism had a 215- gram lower birthweight than those homozygous for the wildtype allele. The data lent support to the hypothesis that genetic variation affecting fetal growth could account for the association between low birthweight and susceptibility to diabetes and cardiovascular disease in later life. Postnatal growth and development are coordinated by genetic and environmental influences and numerous growth factors. Le Roith et al. (2001) reviewed the essential role that the GH- IGFI axis plays in these processes. Although the GH- IGFI axis is a closely coordinated system, both GH and IGFI have independent actions, many of which have become apparent more recently following the characterization of clinical syndromes and the development of mouse models. Genetic manipulation of mice has enabled investigators to reexamine many of the established hypotheses regarding the GH- IGFI axis. Results gleaned from a mouse model created by tissue- specific gene deletion of liver IGFI (Yakar et. al, 1999; Sjogren et al. 1999) enabled investigators to reevaluate the original 'somatomedin hypothesis.' Animal model experiments lend further support to the function of IGF1. Aging skeletal muscles suffer a steady decline in mass and functional performance, and compromised muscle integrity as fibrotic invasions replace contractile tissue. The same programmed deficits in muscle structure and function are found in numerous neurodegenerative syndromes and disease- related cachexia. Musaro et al. (2001) generated a model of persistent, functional myocyte hypertrophy using a tissue- restricted transgene encoding a locally acting isoform of Igf1 that is expressed in skeletal muscle. Transgenic embryos developed normally, and postnatal increases in muscle mass and strength were not accompanied by the additional pathologic changes seen in other Igf1 transgenic models. Expression of Gata2 (OMIM Ref. No. 137295), a transcription factor normally undetected in skeletal muscle, marked hypertrophic myocytes that escaped age- related muscle atrophy and retained the proliferative response to muscle injury characteristic of younger animals. The observations were thought to suggest usefulness of localized expression of this transgene as a clinical strategy for the treatment of age- or disease- related muscle frailty.

It is appreciated that the abovementioned animal model for IGF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the

publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

GAM25	MME	AATTGCTTGAACCCA GGAAGTG	Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_007288.1) is another GAM25 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM25 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM25 is therefore inhibition of MME, a GAM25 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME has been established by previous studies. Common acute lymphocytic leukemia antigen is an important cell surface marker in the diagnosis of human acute lymphocytic leukemia (ALL). It is present on leukemic cells of pre- B phenotype, which represent 85% of cases of ALL. CALLA is not restricted to leukemic cells, however, and is found on a variety of normal tissues. CALLA is a glycoprotein that is particularly abundant in kidney, where it is present on the brush border of proximal tubules and on glomerular epithelium. Letarte et al. (1988) cloned a cDNA coding for CALLA and showed that the amino acid sequence deduced from the cDNA sequence is identical to that of human membrane- associated neutral endopeptidase (NEP; EC 3.4.24.11), also known as enkephalinase. NEP cleaves peptides at the amino side of hydrophobic residues and inactivates several peptide hormones including glucagon, enkephalins, substance P, neurotensin, oxytocin, and bradykinin. By cDNA transfection analysis, Shipp et al. (1989) confirmed that CALLA is a functional neutral endopeptidase of the type that has

previously been called enkephalinase. Barker et al. (1989) demonstrated that the CALLA gene, which encodes a 100- kD type II transmembrane glycoprotein, exists in a single copy of greater than 45 kb which is not rearranged in malignancies expressing cell surface CALLA. D'Adamio et al. (1989) demonstrated that the CALLA gene spans more than 80 kb and is composed of 24 exons. Animal model experiments lend further support to the function of MME. Amyloid-beta peptide (OMIM Ref. No. 104760), the pathogenic agent of Alzheimer disease (OMIM Ref. No. 104300), is a physiologic metabolite in the brain. Iwata et al. (2001) examined the role of neprilysin, a candidate amyloid- beta degrading peptidase, in the metabolism using neprilysin gene- disrupted mice. Neprilysin deficiency resulted in defects both in the degradation of exogenously administered amyloid- beta and in the metabolic suppression of the endogenous amyloid- beta levels in a gene dose-dependent manner. The regional levels of amyloid- beta in the neprilysin- deficient mouse brain were in the distinct order of hippocampus, cortex, thalamus/striatum, and cerebellum, where hippocampus has the highest level and cerebellum the lowest, correlating with the vulnerability to amyloid- beta deposition in brains of humans with Alzheimer disease. Iwata et al. (2001) concluded that even partial downregulation of neprilysin activity, which could be caused by aging, can contribute to Alzheimer disease by promoting amyloid- beta accumulation.

It is appreciated that the abovementioned animal model for MME is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Letarte, M.; Vera, S.; Tran, R.; Addis, J. B. L.; Onizuka, R. J.; Quackenbush, E. J.; Jongeneel, C. V.; McInnes, R. R. : Common acute lymphocytic leukemia antigen is identical to neutr.

Further studies establishing the function and utilities of MME are found in John Hopkins OMIM database record ID 120520, and in cited publications listed in Table 9, hereby incorporated herein.

GAM25 A A NCSTN AATTGCTTGAACCCA GGAAGTG NCSTN (Accession NM_015331.1) is another GAM25 target gene. NCSTN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCSTN, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCSTN BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM25 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM25 is therefore inhibition of NCSTN, a GAM25 target gene which has a central role in presenilin-mediated processing of beta- amyloid precursor protein (beta- APP, MIM 104760) and some aspects of notch (MIM 190198)/glp- 1 signaling in vivo. and therefore is associated with Alzheimer. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCSTN.The function of NCSTN has been established by previous studies. Nicastrin is a type 1 transmembrane glycoprotein that interacts with both presenilin- 1 (PS1; OMIM Ref. No. 104311) and presenilin- 2 (PS2; 600759) and has a central role in presenilin-mediated processing of beta- amyloid precursor protein (beta- APP, 104760) and some aspects of notch (OMIM Ref. No. 190198)/glp- 1 signaling in vivo. Nicastrin regulates gamma- secretase cleavage of the amyloid precursor protein by forming complexes with presenilins, in which most mutations causing familial early- onset Alzheimer disease (EOAD) have been found. The nicastrin gene maps to 1q23, a region that shows evidence for linkage to (Kehoe et al. 1999) and association with (Hiltunen et al. 2001) late- onset Alzheimer disease (LOAD). Dermaut et al. (2002) evaluated the contribution of genetic variations in NCSTN in 2 large series of patients with EOAD (onset at or before age 65 years) and LOAD (onset after age 65 years). In 78 familial EOAD cases, they found 14 NCSTN single-nucleotide polymorphisms (SNPs): 10 intronic SNPs, 3 silent mutations, and 1 missense mutation (N417Y). N417Y was thought not to be pathogenic, since it did not alter amyloid- beta secretion in an in vitro assay and its frequency was similar in case and control subjects. However, SNP haplotype estimation in 2 population- based series of Dutch patients with EOAD (n = 116) and LOAD (n = 240) indicated that the frequency of 1 SNP haplotype (designated HapB) was higher in the group with familial EOAD (7%), compared with the LOAD group (3%) and control group (3%). In patients with familial EOAD without the APOE epsilon- 4 allele (107741.0016), the HapB frequency further increased, to 14%, resulting in a 4- fold increased risk (odds ratio = 4.1). These results were considered compatible with an important role of gamma- secretase dysfunction in the etiology of familial EOAD.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Hiltunen, M.; Mannermaa, A.; Thompson, D.; Easton, D.; Pirskanen, M.; Helisalmi, S.; Koivisto, A. M.; Lehtovirta, M.;

Ryynanen, M.; Soininen, H. : Genome- wide linkage disequilibrium mapping of late- onset Alzheimer's disease in Finland. Neurology 57: 1663- 1668, 2001. ; and

Kehoe, P.; Wavrant- De Vrieze, F.; Crook, R.; Wu, W. S.; Holmans, P.; Fenton, I.; Spurlock, G.; Norton, N.; Williams, H.; Williams, N.; Lovestone, S.; Perez- Tur, J.; Hutton, J.; and 10.

Further studies establishing the function and utilities of NCSTN are found in John Hopkins OMIM database record ID 605254, and in cited publications listed in Table 9, hereby incorporated herein.

GAM25 OLR1 AATTGCTTGAACCCA GGAAGTG Oxidised Low Density Lipoprotein (lectin- like) Receptor 1 A A

(OLR1, Accession NM_002543.1) is another GAM25 target gene. OLR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OLR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OLR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM25 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM25 is therefore inhibition of OLR1, a GAM25 target gene which is involved in degradation of oxidized LDL by vascular endothelial cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM25 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OLR1.The function of OLR1 has been established by previous studies. Endothelial cell dysfunction or activation elicited by oxidatively modified low density lipoprotein (OMIM Ref. No. Ox- LDL) has been implicated in the pathogenesis of atherosclerosis. Vascular endothelial cells internalize and degrade Ox- LDL through a putative receptor- mediated pathway that does not involve macrophage scavenger receptors (see OMIM Ref. No. MSR1; 153622). To identify genes encoding Ox- LDL receptors, Sawamura et al. (1997) transfected mammalian cells with a cDNA expression library derived from bovine aortic endothelial cells and assayed for uptake of labeled Ox- LDL. They recovered a cDNA encoding an Ox- LDL receptor, which they designated lectin- like Ox- LDL receptor- 1 (LOX1). Immunofluorescence studies showed that bovine LOX1 is expressed on the cell surface. Sawamura et al. (1997) cloned a cDNA encoding the human homolog of LOX1 by screening a human lung cDNA library with the bovine LOX1 cDNA. Cells stably expressing human LOX1 showed uptake of labeled Ox- LDL. The predicted 273- amino acid human LOX1 protein is 72% identical to bovine LOX1. Its structure is similar to that of C- type lectins such as CD94 (KLRD1) and NKR- P1 (KLRB1). Northern blot analysis revealed that human LOX1 is expressed as a 2.8- kb mRNA in various tissues, with the most abundant expression in placenta. Yamanaka et al. (1998) determined that LOX1 is expressed in vascular- rich organs but not in lymphocytes. Yamanaka et al. (1998) found that the LOX1 gene spans approximately 15 kb and

consists of 6 exons. By fluorescence in situ hybridization, they mapped the gene to 12p12- p13, where genes of the natural killer cell receptors are clustered.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Sawamura, T.; Kume, N.; Aoyama, T.; Moriwaki, H.; Hoshikawa, H.; Aiba, Y.; Tanaka, T.; Miwa, S.; Katsura, Y.; Kita, T.; Masaki, T. : An endothelial receptor for oxidized low- density lipoprotein. Nature 386: 73- 77, 1997. ; and

Yamanaka, S.; Zhang, X.- Y.; Miura, K.; Kim, S.; Iwao, H. : The human gene encoding the lectin- type oxidized LDL receptor (OLR1) is a novel member of the natural killer gene complex with.

Further studies establishing the function and utilities of OLR1 are found in John Hopkins OMIM database record ID 602601, and in cited publications listed in Table 9, hereby incorporated herein.

GAM31 HTR2C TCAAGTAATCCAGGA A A TAGGCTG 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868.1) is a GAM31 target gene. HTR2C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM31 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM31 is therefore inhibition of HTR2C, a GAM31 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM31 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C has been established by previous studies. Hall (1947) found that DBA/2 mice exhibited genetic susceptibility to audiogenic seizures (AGSs) stimulated by a doorbell mounted in an iron tub. Thereafter, audiogenic seizures were among the intensively studied phenotypes in behavioral genetics. Brennan et al. (1997) found that null mutant mice lacking serotonin 5- HT- 2C receptors are extremely susceptible to AGSs. The onset of susceptibility was between 2 and 3 months of age, with complete penetrance in adult animals. Heisler et al. (2002) hypothesized that 5- HT receptors are expressed in POMC (OMIM Ref. No. 176830) neurons and that action at these receptors mediates a component of the anorexic effect of d- FEN (D- fenfluramine). Heisler et al. (2002) found that up to 80% of alpha- MSH neurons express HTR2C mRNA and that the pattern of coexpression was greatest in the caudal arcuate nucleus of the hypothalamus. Heisler et al.

(2002) demonstrated that direct activation of HTR2C by agonist in rats decreased their food intake and showed increased induction of FOS- like immunoreactivity in a pattern persistent with d- FEN- induced FOS- like immunoreactivity expression in the arcuate nucleus and paraventricular nucleus of the hypothalamus. Heisler et al. (2002) demonstrated that d- FEN directly activates POMC neurons, indicating that central 5- HT systems directly activate POMC neurons.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Heisler, L. K.; Cowley, M. A.; Tecott, L. H.; Fan, W.; Low, M. J.; Smart, J. L.; Rubinstein, M.; Tatro, J. B.; Marcus, J. N.; Holstege, H.; Lee, C. E.; Cone, R. D.; Elmquist, J. K. : Activation of central melanocortin pathways by fenfluramine. Science 297: 609-611, 2002. ; and

Further studies establishing the function and utilities of HTR2C are found in John Hopkins OMIM database record ID 312861, and in cited publications listed in Table 9, hereby incorporated herein.

GAM44 ACE AAGGTGGTGTCATGT TTTGGGG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM44 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM44 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM44 is therefore inhibition of ACE, a GAM44 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE has been established by previous studies. Angiotensin I- converting enzyme (EC 3.4.15.1), or kininase II, is a dipeptidyl carboxypeptidase that plays an important role in blood pressure regulation and electrolyte balance by hydrolyzing angiotensin I into angiotensin II, a potent vasopressor, and aldosterone- stimulating peptide. The enzyme is also able to inactivate bradykinin, a potent vasodilator. Howard et al. (1990) found that the testis- specific form of ACE has its own promoter within intron 12, is encoded by the 3- prime region of the

gene, and is found only in postmeiotic spermatogenic cells and sperm. Exner et al. (2001) focused on the fact that black patients with heart failure have a poorer prognosis than white patients and performed a study comparing racial groups.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Howard, T. E.; Shai, S. Y.; Langford, K. G.; Martin, B. M.; Bernstein, K. E. : Transcription of testicular angiotensin-converting enzyme (ACE) is initiated within the 12th intron of the somatic ACE gene. Molec. Cell. Biol. 10: 4294- 4302, 1990. ; and

Exner, D. V.; Dries, D. L.; Domanski, M. J.; Cohn, J. N. : Lesser response to angiotensin- converting- enzyme inhibitor therapy in black as compared with white patients with left ventricu.

Further studies establishing the function and utilities of ACE are found in John Hopkins OMIM database record ID 106180, and in cited publications listed in Table 9, hereby incorporated herein.

GAM44 APBB2 AAGGTGGTGTCATGT Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

TTTGGGG 2 (Fe65- (APBB2, Accession NM_173075.1) is another GAM44 target gene. APBB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM44 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM44 is therefore inhibition of APBB2, a GAM44 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 has been established by previous studies. The cytoplasmic domain of the Alzheimer disease locus amyloid protein precursor (APP; 107640) binds 4 human phosphotyrosine- binding (PTB) proteins; see APBA1 (OMIM Ref. No. 602414). By use of a yeast 2- hybrid screening of a human brain cDNA library, McLoughlin and Miller (1996) identified 3 of these proteins: the human homolog of Fe65 (APBB1; 602709), an Fe65- like sequence (APBB2), and an X11- like sequence (APBA2; 602712). From a human fetal brain cDNA library, Guenette et al. (1996) also cloned APBB2 based on its interaction with the carboxy terminus of APP. They showed that the APBB2 protein interacts with another amyloid protein precursor, APLP2 (OMIM Ref. No. 104776), but not with APLP1 (OMIM Ref. No. 104775). The APBB2 gene encodes a 730-

amino acid polypeptide that is 51% identical to rat Fe65. Northern blot analysis revealed that APBB2 has widespread expression in human tissues. By use of a radiation hybrid panel, Blanco et al. (1998) mapped the human APBB2 gene to chromosome 4, between the markers D4S405 (OMIM Ref. No. 4.6 cR) and D4S496 (10.1 cR).

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Blanco, G.; Irving, N. G.; Brown, S. D. M.; Miller, C. C. J.; McLoughlin, D. M. : Mapping of the human and murine X11- like genes (APBA2 and Apba2), the murine Fe65 gene (Apbb1), and the human Fe65-like gene (APBB2): genes encoding phosphotyrosine- binding domain proteins that interact with the Alzheimer's disease amyloid precursor protein. Mammalian Genome 9: 473- 475, 1998. ; and

Guenette, S. Y.; Chen, J.; Jondro, P. D.; Tanzi, R. E. : Association of a novel human FE65- like protein with the cytoplasmic domain of the beta- amyloid precursor protein. Proc. Nat. Acad.

Further studies establishing the function and utilities of APBB2 are found in John Hopkins OMIM database record ID 602710, and in cited publications listed in Table 9, hereby incorporated herein.

GAM44 APPBP2 AAGGTGGTGTCATGT TTTGGGG Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is another GAM44 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM44 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM44 is therefore inhibition of APPBP2, a GAM44 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 has been established by previous studies. Epithelial cell surfaces are divided into apical and basolateral domains. The basolateral sorting of cell surface proteins depends on the presence of peptide- based basolateral sorting signals (BaSS) in the cytoplasmic domains of proteins. Amyloid precursor protein (APP; 104760), a basolateral protein implicated in the pathogenesis of Alzheimer disease (AD; 104300), contains a tyrosine- based BaSS. Mutation of the tyrosine results in nonpolarized transport of APP. Using APP- BaSS as bait in a yeast 2- hybrid screen of a HeLa cell

cDNA library, followed by negative selection with a tyr- ala mutant APP- BaSS as bait and 5- prime RACE, Zheng et al. (1998) isolated a cDNA encoding amyloid beta precursor protein- binding protein- 2 (OMIM Ref. No. APPBP2), which they called PAT1 (protein interacting with APP tail- 1). The deduced 585- amino acid hydrophilic APPBP2 protein, which is identical to the uncharacterized KIAA0228 protein identified by Nagase et al. (1996), lacks signal or transmembrane sequences but contains N- and C- terminal globular structures, a coiled coil domain, several protein kinase C phosphorylation sites, and 4 imperfect C- terminal tandem repeats. Binding analysis determined that APPBP2 binds specifically to the tyrosine-containing APP- BaSS and to to the complete cytoplasmic domain of APP; it does not bind to mutant APP- BaSS. Western blot analysis showed that APPBP2 is present as a 70- kD protein in both cytosolic and, together with APP, membrane- associated cell fractions. Immunofluorescence microscopy demonstrated that APPBP2 is present in the Golgi region and that its distribution overlaps that of APP. SDS- PAGE and immunoblotting showed that APPBP2 interacts with microtubules and is functionally associated with APP transport and/or processing. By Northern blot analysis, Nagase et al. (1996) detected ubiquitous expression of KIAA0228 as an approximately 6.5-kb transcript.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201- KIAA0280) deduced by analysis of cDNA clones from cell line KG- 1 and brain. DNA Res. 3: 321- 329, 1996. ; and

Zheng, P.; Eastman, J.; Vande Pol, S.; Pimplikar, S. W. : PAT1, a microtubule- interacting protein, recognizes the basolateral sorting signal of amyloid precursor protein. Proc. Nat. Aca.

Further studies establishing the function and utilities of APPBP2 are found in John Hopkins OMIM database record ID 605324, and in cited publications listed in Table 9, hereby incorporated herein.

GAM44 DHCR24 AAGGTGGTGTCATGT A A TTTGGGG 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is another GAM44 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM44 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM44 is therefore inhibition of DHCR24, a GAM44 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 has been established by previous studies. Sarkar et al. (2001) showed that the gene encoding seladin- 1, a human homolog of the Diminuto/Dwarf1 gene described in plants and C. elegans, has adenoma- specific overexpression. Northern blot analysis revealed that seladin- 1 mRNA was overexpressed in the adenoma tissue of 14 patients with Cushing syndrome in comparison to the adjacent nontumorous adrenal gland. In situ hybridization using a seladin- 1 cRNA probe showed its abundant expression in the tumor cells, whereas the nontumorous cells showed a low level of expression. Almost no apoptotic cell was detected in the tumor or in the normal adrenal cortex where seladin- 1 expression was abundant. The authors noted that their results were compatible with a recent report that seladin- 1 acts as an antiapoptotic factor in neurons (Greeve et al. 2000). In addition, expression of seladin- 1 in the normal adrenal cortex was most abundant in the zona fasciculata, suggesting its possible regulation by ACTH/cAMP. The authors concluded that the overexpression of seladin- 1 in the adenoma could be due to the abundant expression of ACTH receptor and hypothesized that seladin- 1 might be involved in the molecular events of adrenocortical tumorigenesis by facilitating steroid synthesis and cell growth. In a severely affected infant with desmosterolosis (OMIM Ref. No. 602398), Waterham et al. (2001) identified 3 mutations in the DHCR24 gene. The mutation inherited from the mother was a 1412A- C change resulting in a tyr471- to- ser (Y471S) substitution. Expression studies in S. cerevisiae showed nondetectable activity of this variant, consistent with the severe phenotype of the patient. Two mutations on the same allele were inherited from the father: an 881A- C change resulting in an asn294- to- thr substitution (N294T), and a 918G- C change resulting in a lys306- to- asn (K306N) substitution (606418.0002). Expression studies in S. cerevisiae of the N294T and K306N variants showed 14.4% and 49.8% of wildtype activity, respectively. Expression studies in S. cerevisiae of an allele with both mutations from the father showed less than 1% of wildtype activity. To determine whether one of the mutations inherited from the father was a common polymorphic variant, 50 alleles of controls were analyzed but neither mutation was detected.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Further studies establishing the function and utilities of DHCR24 are found in John Hopkins OMIM database record ID 606418, and in cited publications listed in Table 9, hereby incorporated herein.

GAM44 PRND AAGGTGGTGTCATGT TTTGGGG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM44 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM44 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM44 is therefore inhibition of PRND, a GAM44 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND has been established by previous studies. Lu et al. (2000) characterized the expression and structure of DPL by matrix-assisted laser desorption ionization (MALDI) mass spectrometry and electrospray mass spectrometry. Unlike PRP, DPL has a second disulfide bond that may contribute to the stability of its uniquely folded alpha- helical core. Lu et al. (2000) noted that PRP is most highly expressed in brain, whereas DPL is enriched in testis. Biochemical analysis determined that DPL resembles PRP in terms of solubility and protease sensitivity and undergoes cooperative and reversible unfolding during thermal denaturation. Silverman et al. (2000) showed that recombinant Dpl refolded under standard conditions adopts an alpha- helical conformation. When expressed in mouse neuroblastoma cells, Dpl possessed 2 N- linked oligosaccharides and was attached to the cell surface via a GPI anchor, much like the cellular prion protein. Dpl was present in brain samples of Rcm0 mice, which develop progressive ataxia with loss of Purkinje cells at around 70 weeks of age, but was absent in equivalent samples from asymptomatic Zurich and wildtype mice. Schroder et al. (2001) investigated whether there are any polymorphisms within the PRND gene that might cause or be involved in the development of transmissible spongiform encephalopathies. They screened the complete open reading frame of the human gene from 58 patients who had died of genetic or sporadic Creutzfeldt- Jakob disease (CJD; 123400), Alzheimer disease (OMIM Ref. No. 104300), or other neurologic disorders, and from 111 controls. They found 5

novel polymorphisms and 1 frameshift mutation. One silent polymorphism, which did not lead to an altered amino acid sequence, was also observed. Statistical analysis revealed a significant difference in the distribution of the PRND genotype at codon 174 between sporadic CJD patients and healthy controls. Like other investigators, they found no evidence that the strong association between sporadic CJD and the PRNP polymorphism at codon 129 (176640.0005) is influenced by different PRND genotypes.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Further studies establishing the function and utilities of PRND are found in John Hopkins OMIM database record ID 604263, and in cited publications listed in Table 9, hereby incorporated herein.

GAM44 PSEN1 AAGGTGGTGTCATGT PSEN1 (Accession NM_000021.2) is another GAM44 target gene. A A

TTTGGGG PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM44 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM44 is therefore inhibition of PSEN1. Accordingly, utilities of GAM44 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM55 CAV2 CTGCCATTTCCAGGA Caveolin 2 (CAV2, Accession NM_001233.2) is a GAM55 target A A

GATCACC gene. CAV2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAV2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM55 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM55 is therefore inhibition of CAV2, a GAM55 target gene which may function as an accessory protein in conjunction with caveolin- 1and act as a scaffolding protein within caveolar membranes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV2.The function of CAV2 has been established by previous studies. Scherer et al. (1996) identified a protein related to caveolin- 1 (CAV1; 601047) through microsequencing of adipocyte- derived caveolin- enriched membranes. They called the novel protein caveolin- 2. They stated that caveolins- 1 and - 2 are similar in most respects. For both caveolin- 1 and caveolin- 2, mRNAs are most abundantly expressed in white adipose tissue and are induced during adipocyte differentiation. Caveolin- 2 localizes with caveolin- 1, indicating that caveolin- 2 also localizes to caveolae. However, caveolin- 1 and caveolin- 2 differ in their functional interactions with heterotrimeric G proteins, possibly explaining why caveolins 1 and 2 are coexpressed within a single cell. Specifically, Scherer et al. (1996) found that whereas residues 82 to 101 of murine caveolin- 1 functionally suppressed the basal GTPase activity of purified heterotrimeric G proteins, the corresponding region of caveolin- 2 (which is 30% identical) had a stimulatory effect. Engelman et al. (1998) reviewed the molecular genetics of the caveolin gene family. They compared the genomic organization of the CAV1, CAV2, and CAV3 (OMIM Ref. No. 601253) genes. The CAV1 gene contains 3 exons, while the human CAV2 gene contains 2 exons. The boundary of the last exon of CAV1 and CAV2 are analogous, suggesting that they arose through gene duplication. The genes encoding murine caveolin- 1 and - 2 are colocalized within the A2 region of mouse chromosome 6 (Engelman et al. 1998). By FISH, Engelman et al. (1998) mapped CAV1 and CAV2 to 7q31.1- q31.2. (CA)n microsatellite repeat marker analysis of the CAV genomic clones indicated that they contain the marker D7S522, located at 7q31.1. Thus, the 2 genes map to 7q31 in a region of conserved synteny with murine 6- A2 (2,3:Engelman et al. 1998, 1998).

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

caveolin- 2 defines a caveolin gene family. Proc. Nat. Ac.

Further studies establishing the function and utilities of CAV2 are found in John Hopkins OMIM database record ID 601048, and in cited publications listed in Table 9, hereby incorporated herein.

GAM55 B A ABCD1 TGGCATC GGTGGGTTTCCTTAA ABCD1 (Accession NM_000033.2) is another GAM55 target gene. ABCD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ABCD1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM55 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM55 is therefore inhibition of ABCD1. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ABCD1.

GAM55 A APBA1 TGGCATC GGTGGGTTTCCTTAA Amyloid Beta (A4) Precursor Protein- binding, Family A, Member B 1 (X11) (APBA1, Accession NM_001163.2) is another GAM55 target gene. APBA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM55 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM55 is therefore inhibition of APBA1, a GAM55 target gene which stabilises APP and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA1.The function of APBA1 has been established by previous studies. Abnormal processing of the membrane- spanning amyloid precursor protein (APP; 104760), resulting in the production of increased amounts of fibrillogenic beta- amyloid peptide (OMIM Ref. No. A- beta), is considered to be one of the key metabolic events underlying Alzheimer disease (OMIM Ref. No. 104300). One pathway for A- beta production involves the reinternalization of membrane- bound APP into lysosomes where APP containing intact A- beta are generated. In common with a number of cell surface receptors, the C- terminal cytoplasmic domain of APP contains an asn- pro- thr- tyr (NPTY) motif that mediates re- internalization via clathrin- coated pits (Chen et al. 1990). This motif has also been demonstrated to be a consensus sequence for binding to phosphotyrosine- binding/- interacting domain (PTB)- bearing proteins (van der Geer and Pawson, 1995). Several groups

demonstrated that the cytoplasmic domain of APP binds to 4 human PTB proteins: X11, X11- like (APBA2; 602712), Fe65 (APBB1; 602709), and Fe65- like (APBB2; 602710). PTB- domain proteins are believed to be involved in signal transduction processes, and the interaction of APP with the 4 human PTB proteins suggest a role for APP in such signal transaction mechanisms. Furthermore, as the 4 proteins interact with the YENPTY motif in APP, these PTB proteins may modulate processing of APP and hence formation of A- beta. Blanco et al. (1998) pointed out that it is generally agreed that there are as yet unidentified susceptibility genes for Alzheimer disease. The genes APBA1, APBA2, APBB1, and APBB2 represent such candidate genes. By searching for proteins that bind to Munc18- 1 (OMIM Ref. No. 602926), Okamoto and Sudhof (1997) isolated rat cDNAs encoding Mint1 and Mint2. They determined the full- length human MINT1 cDNA sequence (GenBank AF029106) using human MINT1 ESTs. The deduced 837- amino acid MINT1 protein contains an N- terminal domain that binds to Munc18- 1, a middle phosphotyrosine- binding (PTB) domain that binds to phosphatidylinositol phosphates, and 2 C- terminal PDZ domains. The rat Mint1 protein is largely membrane- bound and copurifies with synaptic plasma membranes, but it is not a component of synaptic vesicles. The authors suggested that in the brain Mint1 is part of a multimeric complex containing Munc18- 1 and syntaxin- 1 (OMIM Ref. No. 186590) that likely functions as an intermediate in synaptic vesicle docking/fusion.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

GAM55	APPBP2	GGTGGGTTTCCTTAA TGGCATC	Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is another GAM55 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide	B	A

sequence of GAM55 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM55 is therefore inhibition of APPBP2, a GAM55 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM55	MAPK10	GGTGGGTTTCCTTAA TGGCATC	Mitogen- activated Protein Kinase 10 (MAPK10, Accession NM_138981.1) is another GAM55 target gene. MAPK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM55 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	B	A

Another function of GAM55 is therefore inhibition of MAPK10, a GAM55 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM55 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 has been established by previous studies. Using a yeast 2- hybrid screen, McDonald et al. (2000) identified JNK3 as a binding partner of beta- arrestin- 2 (ARBB2; 107941). These results were confirmed by coimmunoprecipitation from mouse brain extracts and cotransfection in COS7 cells. The upstream JNK activators apoptosis signal- regulating kinase- 1 (ASK1; 602448) and MKK4 (OMIM Ref. No. 601335) were also found in complex with ARBB2. Cellular transfection of ARBB2 caused cytosolic retention of JNK3 and enhanced JNK3 phosphorylation stimulated by ASK1. Moreover, stimulation of the angiotensin II type 1A receptor (AGTR1; 106165) activated JNK3 and triggered the colocalization of ARBB2 and active JNK3 to intracellular vesicles. Thus, McDonald et al. (2000) concluded that ARBB2 acts as a scaffold protein, which brings the spatial distribution and activity of this MAPK module under the control of a G protein- coupled receptor. Yoshida et al. (2001) mapped the MAPK10 gene to 4q21- q22 by fluorescence in situ hybridization and radiation hybrid mapping. They found loss of expression EST markers in the 4q21- q22 region that correspond to the JNK3 gene in 10 of 19 cell lines derived from brain tumors. Together with previous evidence that the Jnk3 signaling pathway mediates apoptosis in

central nervous tissue in Jnk3- deficient mice (Yang et al. 1997), the results suggested that loss of expression of the JNK3 gene may play an important role in the development of brain tumors in humans

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Further studies establishing the function and utilities of MAPK10 are found in John Hopkins OMIM database record ID 602897, and in cited publications listed in Table 9, hereby incorporated herein.

GAM66 ARHA TTTGCACCTGAGACA Ras Homolog Gene Family, Member A (ARHA, Accession NM_001664.1) A A

GATAGCC is a GAM66 target gene. ARHA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ARHA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM66 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM66 is therefore inhibition of ARHA, a GAM66 target gene which regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. and therefore is associated with Alzheimer. Accordingly, utilities of GAM66 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ARHA.The function of ARHA has been established by previous studies. The small guanosine triphosphatase (GTP) Rho regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. In their Figure 3C, Maekawa et al. (1999) diagrammed proposed signaling pathways for Rho- induced remodeling of the actin cytoskeleton. They demonstrated that active Rho signals to its downstream effector ROCK1 (OMIM Ref. No. 601702), which phosphorylates and activates LIM kinase (see OMIM Ref. No. 601329). LIM kinase, in turn, phosphorylates cofilin (OMIM Ref. No. 601442), inhibiting its actin- depolymerizing activity. Rao et al. (2001) investigated the role of Rho kinase in the modulation of aqueous humor outflow facility. The treatment of human trabecular meshwork and canal of Schlemm cells with a Rho kinase- specific inhibitor led to significant but reversible changes in cell shape

and decreased actin stress fibers, focal adhesions, and protein phosphotyrosine staining. Based on the Rho kinase inhibitor- induced changes in myosin light chain phosphorylation and actomyosin organization, the authors suggested that cellular relaxation and loss of cell- substratum adhesions in the human trabecular meshwork and canal of Schlemm cells could result in either increased paracellular fluid flow across the canal of Schlemm or altered flow pathway through the juxtacanalicular tissue, thereby lowering resistance to outflow. They suggested Rho kinase as a potential target for the development of drugs to modulate intraocular pressure in glaucoma patients.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Further studies establishing the function and utilities of ARHA are found in John Hopkins OMIM database record ID 165390, and in cited publications listed in Table 9, hereby incorporated herein.

GAM83 ACE AAGGTGGTGTCATGT TTTGGGG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM83 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM83 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM83 is therefore inhibition of ACE, a GAM83 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM83 APBB2 AAGGTGGTGTCATGT Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

TTTGGGG 2 (Fe65- (APBB2, Accession NM_173075.1) is another GAM83 target gene. APBB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM83 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM83 is therefore inhibition of APBB2, a GAM83 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM83 APPBP2 AAGGTGGTGTCATGT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
TTTGGGG Protein 2 (APPBP2, Accession NM_006380.2) is another GAM83 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM83 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM83 is therefore inhibition of APPBP2, a GAM83 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM83 DHCR24 AAGGTGGTGTCATGT 24- dehydrocholesterol Reductase (DHCR24, Accession A A
TTTGGGG NM_014762.1) is another GAM83 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM83 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM83 is therefore inhibition of DHCR24, a GAM83 target gene which catalyzes the reduction of sterol

intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM83 PRND AAGGTGGTGTCATGT TTTGGGG A A Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM83 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM83 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM83 is therefore inhibition of PRND, a GAM83 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM83 PSEN1 AAGGTGGTGTCATGT TTTGGGG A A PSEN1 (Accession NM_000021.2) is another GAM83 target gene. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM83 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM83 is therefore inhibition of PSEN1. Accordingly, utilities of GAM83 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM99 BACE TGGAGAGATAAGCCA AGTATCC A A Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) is a GAM99 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM99 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM99 is therefore inhibition of BACE, a GAM99 target gene which is responsible for the proteolytic

processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE has been established by previous studies. Cerebral deposition of amyloid beta peptide is an early and critical feature of Alzheimer disease (AD; 104300). Amyloid beta generation depends on proteolytic cleavage of amyloid precursor protein (APP; 104760) by 2 proteases, beta- secretase and gamma- secretase. Vassar et al. (1999) reported the cloning of a human transmembrane aspartic protease that had all the known characteristics of the beta-secretase. Using an expression cloning strategy, they identified a clone that shared significant sequence similarity with members of the pepsin subfamily of aspartic proteases. This clone encoded a novel protein, designated BACE for 'beta- site APP- cleaving enzyme.' The BACE open reading frame encodes a protein of 501 amino acids containing a 21- amino acid signal peptide followed by a proprotein domain spanning amino acids 22 to 45. The lumenal domain of the mature protein is followed by 1 predicted transmembrane domain and a short cytosolic C- terminal tail of 24 amino acids. BACE was predicted to be a type 1 transmembrane protein with the active site on the lumenal side of the membrane, where beta-secretase cleaves APP. The BACE protein shares greatest amino acid identity (30%) with cathepsin E (OMIM Ref. No. 116890). Rat and mouse BACE orthologs have 96% amino acid sequence identity with the human BACE protein. Northern blot analysis of human BACE mRNA in adult peripheral tissues and various subregions of the brain detected 3 transcripts of approximately 7.0, 4.4, and 2.6 kb. By in situ hybridization, expression of BACE mRNA in rat brain was observed at higher levels in neurons than in glia, supporting the idea that neurons are the primary source of the extracellular A-beta deposited in amyloid plaques. Vassar et al. (1999) ascribed the difference between the apparent and calculated molecular weight (approximately 70 and 51 kD, respectively) of the BACE protein to N-linked glycosylation. Immunostaining demonstrated intracellular localization of BACE to the Golgi and endosomes. Transient overexpression of BACE did not affect APP expression, but decreased alpha- secretase cleavage and increased beta- secretase activity in cells expressing wildtype or Swedish mutant (104760.0008) APP. BACE overexpression induced cleavage only at the known beta- secretase positions, asp1 and glu11. Vassar et al. (1999) concluded that their data provided strong evidence that the BACE aspartic protease is the long- sought beta- secretase. Animal model experiments lend further support to the function of BACE. Luo et al. (2001) found that mice deficient in BACE1 are healthy, fertile, and appear normal in gross anatomy, tissue histology, hematology, and clinical chemistry. Bace1 - /- mice who are also hemizygous for an amyloid precursor protein transgene lack brain beta- amyloid and beta- secretase- cleaved APP C- terminal fragments. These results provided validation of BACE1 as the major beta- secretase in vivo and suggested that therapeutic

inhibition of BACE1 for the treatment of Alzheimer disease may be free of mechanism- based toxicity.

It is appreciated that the abovementioned animal model for BACE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

B.; Ross, S.; Amaranta, P.; Loeloff, R.; Luo, Y.; Fisher, S.; and 12 others : Beta- secretase cleavage of Alzheimer's amyloid precursor protein by the transmembrane aspartic protease BACE. Science 286: 735- 741, 1999. ; and

Luo, Y.; Bolon, B.; Kahn, S.; Bennett, B. D.; Babu- Khan, S.; Denis, P.; Fan, W.; Kha, H.; Zhang, J.; Gong, Y.; Martin, L.; Louis, J.- C.; Yan, Q.; Richards, W. G.; Citron, M.; Vassar, R.

Further studies establishing the function and utilities of BACE are found in John Hopkins OMIM database record ID 604252, and in cited publications listed in Table 9, hereby incorporated herein.

GAM99 CTSK TGGAGAGATAAGCCA CTSK (Accession NM_000396.2) is another GAM99 target gene. CTSK A A
AGTATCC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSK BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM99 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM99 is therefore inhibition of CTSK. Accordingly, utilities of GAM99 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSK.

GAM99 TNF TGGAGAGATAAGCCA Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, A A
AGTATCC Accession NM_000594.2) is another GAM99 target gene. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM99 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM99 is therefore inhibition of TNF, a GAM99 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly,

utilities of GAM99 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNF.The function of TNF has been established by previous studies. Ruuls and Sedgwick (1999) reviewed the problem of unlinking TNF biology from that of the MHC. Dysregulation and, in particular, overproduction of TNF have been implicated in a variety of human diseases, including sepsis, cerebral malaria, and autoimmune diseases such as multiple sclerosis (OMIM Ref. No. 126200), rheumatoid arthritis, systemic lupus erythematosus (OMIM Ref. No. 152700), and Crohn disease (see OMIM Ref. No. 266600), as well as cancer. Susceptibility to many of these diseases is thought to have a genetic basis, and the TNF gene is considered a candidate predisposing gene. However, unraveling the importance of genetic variation in the TNF gene to disease susceptibility or severity is complicated by its location within the MHC, a highly polymorphic region that encodes numerous genes involved in immunologic responses. Ruuls and Sedgwick (1999) reviewed studies that had analyzed the contribution of TNF and related genes to susceptibility to human disease, and they discussed how the presence of the TNF gene within the MHC may potentially complicate the interpretation of studies in animal models in which the TNF gene is experimentally manipulated. Animal model experiments lend further support to the function of TNF. Bruce et al. (1996) used targeted gene disruption to generate mice lacking either the p55 or the p75 TNF receptors; mice lacking both p55 and p75 were generated from crosses of the singly deficient mice. The TNFR- deficient (TNFR- KO) mice exhibited no overt phenotype under unchallenged conditions. Bruce et al. (1996) reported that damage to neurons caused by focal cerebral ischemia and epileptic seizures was exacerbated in the TNFR- KO mice, indicating that TNF serves a neuroprotective function. Their studies indicated that TNF protects neurons by stimulating antioxidative pathways. Injury- induced microglial activation was suppressed in TNFR- KO mice. They concluded that drugs which target TNF signaling pathways may prove beneficial in treating stroke or traumatic brain injury.

It is appreciated that the abovementioned animal model for TNF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Ruuls, S. R.; Sedgwick, J. D. : Unlinking tumor necrosis factor biology from the major histocompatibility complex: lessons from human genetics and animal models. Am. J. Hum. Genet. 65: 294- 301, 1999. ; and

Bruce, A. J.; Boling, W.; Kindy, M. S.; Peschon, J.; Kraemer, P. J.; Carpenter, M. K.; Holtsberg, F. W.; Mattson, M. P. : Altered neuronal and microglial responses to excitotoxic and is.

Further studies establishing the function and utilities of TNF are found in John Hopkins OMIM database record ID 191160, and in cited publications listed in Table 9, hereby incorporated herein.

GAM106 A FPRL1 A ATTAGCTATAGCAAA AGGCTTA FPRL1 (Accession NM_001462.1) is a GAM106 target gene. FPRL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM106 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM106 is therefore inhibition of FPRL1. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM106 A S100B A ATTAGCTATAGCAAA AGGCTTA S100 Calcium- binding Protein, Beta (neural) (S100B, Accession NM_006272.1) is another GAM106 target gene. S100B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of S100B BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM106 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM106 is therefore inhibition of S100B, a GAM106 target gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. and therefore is associated with Alzheimer. Accordingly, utilities of GAM106 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with S100B.The function of S100B has been established by previous studies. See 176940. The beta- subunit of S100 protein is expressed in glial cells at levels at least tenfold higher than in most other cell types. The brain also contains small amounts of the alpha subunits at levels approximately one- tenth that of the beta subunit. Allore et al. (1988) used genomic and cDNA probes in connection with a panel of rodent- human somatic cell hybrids to assign the S100B gene to 21q22. They suggested that this is a candidate gene for the neurologic disturbances in Down syndrome when present in trisomic state. By in situ hybridization, Duncan et al. (1989) localized the S100B gene to 21q22.2- q22.3. Allore et al. (1990) isolated overlapping genomic clones spanning the region coding for S100B and its flanking sequences. The intron/exon organization is similar to that of the

genes coding for several other members of the S100 protein subfamily. The S100B gene is composed of 3 exons, the first of which specifies the 5- prime untranslated region. Morii et al. (1991) isolated the S100A (OMIM Ref. No. 176940) and S100B genes from a human genomic DNA library. Endonuclease mapping and DNA sequencing showed that both comprise 3 exons and 2 introns. Two Ca(2)- binding domains were independently encoded by exons 2 and 3. By spot- blot hybridization analysis of flow- sorted chromosomes, Morii et al. (1991) showed that the S100A and S100B genes are located on chromosome 1 and chromosome 21, respectively. Using restriction endonuclease fragment length variations (RFLV) in multipoint backcrosses, Shimizu et al. (1992) mapped the S100b gene in relation to other genes on mouse chromosome 10. The S100B gene is expressed at high levels in brain primarily by astrocytes. Addition of the disulfide- bonded dimeric form of the protein to primary neuronal and glial cultures and established cell lines induces axonal extension and alterations in astrocyte proliferation and phenotype. Reeves et al. (1994) demonstrated that the same effects of the S100B protein are exerted in vivo. They found that both astrocytosis and neurite proliferation occurred in transgenic mice expressing elevated levels of S100b. They suggested that these transgenic mice represent a useful model for studies of the role of S100B in glial-neuronal interactions in normal development and function of the brain and for analyzing the significance of elevated levels of the protein in Down syndrome and Alzheimer disease.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Reeves, R. H.; Yao, J.; Crowley, M. R.; Buck, S.; Zhang, X.; Yarowsky, P.; Gearhart, J. D.; Hilt, D. C. : Astrocytosis and axonal proliferation in the hippocampus of S100b transgenic mice. Proc. Nat. Acad. Sci. 91: 5359- 5363, 1994. ; and

Shimizu, A.; Sakai, Y.; Ohno, K.; Masaki, S.; Kuwano, R.; Takahashi, Y.; Miyashita, N.; Watanabe, T. : A molecular genetic linkage map of mouse chromosome 10, including the Myb, S100b, P.

Further studies establishing the function and utilities of S100B are found in John Hopkins OMIM database record ID 176990, and in cited publications listed in Table 9, hereby incorporated herein.

GAM112 APP TGATATATAATCAGC APP (Accession NM_000484.1) is a GAM112 target gene. APP A A

CCATGAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM112 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM112 is therefore inhibition of APP. Accordingly, utilities of GAM112 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APP.

GAM144 AVP CTGTGCCTGTGACGA AVP (Accession NM_000490.2) is a GAM144 target gene. AVP A A
GGGATGA BINDING SITE1 and AVP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by AVP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE1 and AVP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM144 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM144 is therefore inhibition of AVP. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM144 MAPT CTGTGCCTGTGACGA Microtubule- associated Protein Tau (MAPT, Accession A A
GGGATGA NM_173727.1) is another GAM144 target gene. MAPT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM144 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM144 is therefore inhibition of MAPT, a GAM144 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT has been established by previous studies. The microtubule- associated proteins (MAPs) coassemble with tubulin (see OMIM Ref. No. 602529) into microtubules in vitro. Microtubule- associated protein tau appears to be enriched in axons. Neve et al. (1986) identified tau cDNA clones in a human fetal brain cDNA library. The clones recognized a 6- kb message that was expressed in human brain but not in other human tissues and exhibited a developmental shift in size. By screening cDNA libraries prepared from the frontal cortex of an Alzheimer disease patient and from fetal human brain, Goedert et al. (1988) isolated the cDNA for a core protein of the paired helical filament of Alzheimer disease (OMIM Ref. No. 104300). The partial amino acid sequence of this core protein was used to design synthetic oligonucleotide probes. The cDNA encodes a protein of 352 amino acids that contains a characteristic amino acid repeat in its carboxyl- terminal half. Because of extensive homology to the

sequence of the mouse microtubule- associated protein tau, they stated that this protein must constitute the human equivalent of mouse tau. Tau protein mRNA was found in normal amounts in the frontal cortex from patients with Alzheimer disease. Hutton et al. (1998) studied 13 families in which an autosomal dominant inherited dementia, frontotemporal dementia with parkinsonism (OMIM Ref. No. 600274), had been shown to be linked to chromosome 17. The authors stated that this disorder has historically been termed Pick disease (OMIM Ref. No. 172700). Most cases showed neuronal and/or glial inclusions that stained positively with antibodies raised against tau, although the tau pathology varied considerably in both its quantity (or severity) and characteristics. This form of dementia, symbolized FTDP17 by them, had been mapped to a 2- cM region on 17q21.11. Since the tau gene was known to lie within this region and because the disorder was recognized to be a 'tauopathy,' Hutton et al. (1998) sequenced the MAPT gene in the thirteen 17- linked families and identified 3 missense mutations (gly272 to val, 157140.0002; pro301 to leu, 157140.0001; and arg406 to trp, 157140.0003) and 3 mutations in the 5- prime splice site of exon 10. All of the splice site mutations destabilized a potential stem- loop structure that is probably involved in regulating the alternative splicing of exon 10 (Goedert et al. 1989). This caused more frequent usage of the 5- prime splice site and an increased proportion of tau transcripts that include exon 10. The increase in exon 10 mRNA was expected to increase the proportion of tau containing 4 microtubule-binding repeats, which is consistent with the neuropathology described in families with FTDP17. Hong et al. (1998) indicated that more than 10 exonic and intronic mutations of the MAPT gene had been identified in about 20 FTDP17 families. They found that analyses of soluble and insoluble tau proteins from brains of FTDP17 patients indicated that different pathogenic mutations differentially altered distinct biochemical properties and stoichiometry of brain tau isoforms. Functional assays of recombinant tau proteins with different FTDP17 missense mutations implicated all but 1 of these mutations in disease pathogenesis by reducing the ability of tau to bind microtubules and promote microtubule assembly. In a study of frontotemporal dementia in the Netherlands during the period January 1994 to June 1998, Rizzu et al. (1999) found 37 patients who had one or more first- degree relatives with dementia. A mutation in the MAPT gene was found in 17.8% of the group of patients with FTDP17 and in 43% of patients with FTDP17 who also had a positive family history of the disorder. Three distinct missense mutations, G272V (157140.0002), P301L (157140.0001), and R406W (157140.0003), accounted for 15.6% of the mutations. These 3 missense mutations, and a single amino acid deletion, K280del, that was detected in 1 patient, strongly reduced the ability of tau to promote microtubule assembly. In some FTDP17 families, MAPT mutations have not been found, suggesting locus and/or allelic heterogeneity. Rizzu et al. (1999) suggested that the MAPT mutations may result in disturbances in the interactions of the protein tau with microtubules, resulting

in hyperphosphorylation of tau protein, assembly into filaments, and subsequent cell death. Verpillat et al. (2002) found that the tau H1/H1 genotype was significantly overrepresented in 100 patients with frontotemporal dementia compared to controls (odds ratio for H1/H1 = 1.95). In addition, there was a significant negative effect in carriers of both the H1/H1 genotype and the APOE2 allele (OMIM Ref. No. 107741). The association of intronic mutations in the MAPT gene in frontotemporal dementia with parkinsonism (e.g. 157140.0004) highlights the involvement of aberrant pre- mRNA splicing in the pathogenesis of neurodegenerative disorders. To establish a model system for studying the role of pre- mRNA splicing in neurodegenerative diseases, Jiang et al. (2000) constructed a MAPT minigene that reproduced alternative splicing in both cultured cells and in vitro biochemical assays. They demonstrated that mutations in a nonconserved intronic region of the human MAPT gene led to increased splicing between exons 10 and 11. Systematic biochemical analyses indicated the importance of U1 snRNP (OMIM Ref. No. 180740) and, to a lesser extent, U6 snRNP (OMIM Ref. No. 180692) in differentially recognizing wildtype versus intron- mutant MAPT pre-mRNAs. Goedert et al. (1998) reviewed the role of tau mutations in frontotemporal dementias. Heutink (2000) reviewed the role of tau protein in frontotemporal dementia and other neurodegenerative disorders. Hutton (2001) reviewed the known missense and splice site mutations in the tau gene that are associated with disease and described different mechanisms involved in pathogenesis, including disruption of the interaction between tau and tubulin, deposition of abnormal tau filaments, and the generation of abnormal ratios of tau isoforms. Animal model experiments lend further support to the function of MAPT. Lewis et al. (2000) demonstrated that expression of human tau containing the most common mutation, P301L (157140.0001), results in motor and behavioral deficits in transgenic mice, with age- and gene- dose- dependent development of neurofibrillary tangles (NFT).

It is appreciated that the abovementioned animal model for MAPT is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Hutton, M.; Lendon, C. Rizzu, P.; Van Swieten, J. C.; Joosse, M.; Hasegawa, M.;

Stevens, M.; Tibben, A.; Niermeijer, M. F.; Hillebrand, M.; Ravid, R.; Oostra, B. A.; Goedert, M.; van Duijn, C. M.; Heutink, P.

Further studies establishing the function and utilities of MAPT are found in John Hopkins OMIM database record ID 157140, and in cited publications listed in Table 9, hereby incorporated herein.

GAM144 A A TGFB1 CTGTGCCTGTGACGA GGGATGA TGFB1 (Accession NM_000660.1) is another GAM144 target gene. TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM144 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM144 is therefore inhibition of TGFB1. Accordingly, utilities of GAM144 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM175 A A CNTF GACCCTGTGTTCAAG GTTAGGG Ciliary Neurotrophic Factor (CNTF, Accession NM_000614.2) is a GAM175 target gene. CNTF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNTF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CNTF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM175 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM175 is therefore inhibition of CNTF, a GAM175 target gene which is a survival factor for various neuronal cell types. and therefore is associated with Alzheimer. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CNTF.The function of CNTF has been established by previous studies. Takahashi et al. (1994) identified an apparent polymorphism of the CNTF gene. An acceptor splice site mutation caused aberrant mRNA splicing and abolished expression of CNTF protein. The specific change was a G- to- A transition at position - 6 of the acceptor splice site leading to insertion of 4 additional ribonucleotides at the beginning of the next exon. This caused a frameshift from amino acid 39, resulting in a stop codon 24 amino acids downstream. (The normal open reading frame codes for 200 amino acids.) The aberrant mRNA was predicted to code for a truncated protein of 62 amino acids. Analysis of tissue samples and transfection of CNTF minigenes into cultured cells demonstrated to Takahashi et al. (1994) that the mutated allele expressed only the mutated mRNA species. Studies with an antiserum that recognized both the normal and mutated CNTF showed complete lack of CNTF immunoreactivity in peripheral nerve tissue

from a homozygous mutant subject. In 391 Japanese people tested, 61.9% were normal homozygotes, 39.8% heterozygotes, and 2.3% mutant homozygotes. The distribution of the 3 genotypes were similar in healthy and neurologic disease subjects, indicating that human CNTF deficiency is not causally related to neurologic diseases In 7 of 288 patients with multiple sclerosis (OMIM Ref. No. 126200), Giess et al. (2002) identified homozygosity for the CNTF null mutation. The 7 patients demonstrated a significantly earlier age of onset of disease (17 years) compared to patients carrying at least 1 functional CNTF allele (27 years). Six of the 7 patients with the null allele (85%) had marked motor or brainstem symptoms and incomplete remission, which was detected in only 21% of the other patients with MS. Giess et al. (2002) noted that the null allele is very rare, and that the frequency of the homozygous null allele in this group is the same as in control groups, thus indicating that the genotype itself is not a risk factor for development of MS. However, they suggested that trophic support of neurons and oligodendrocytes by CNTF may be critical to reduce early damage caused by inflammatory mediators, and that lack of functional CNTF may lead to earlier onset of clinical symptoms in MS

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Barbin, G.; Manthorpe, M.; Varon, S. : Purification of the chick eye ciliary neuronotrophic factor. J. Neurochem. 43: 1468-1478, 1984. ; and

Takahashi, R.; Yokoji, H.; Misawa, H.; Hayashi, M.; Hu, J.; Deguchi, T. : A null mutation in the human CNTF gene is not causally related to neurological diseases. Nature Genet. 7: 79- 84.

Further studies establishing the function and utilities of CNTF are found in John Hopkins OMIM database record ID 118945, and in cited publications listed in Table 9, hereby incorporated herein.

GAM175 A GFAP A GACCCTGTGTTCAAG GTTAGGG GFAP (Accession NM_002055.2) is another GAM175 target gene. GFAP BINDING SITE1 and GFAP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GFAP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE1 and GFAP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM175 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM175 is therefore inhibition of GFAP. Accordingly, utilities of GAM175 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM189 APPBP2 CATTGCACTCCAGCC TGGGCAA Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM189 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM189 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM189 is therefore inhibition of APPBP2, a GAM189 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM189 BACE2 CATTGCACTCCAGCC TGGGCAA Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is another GAM189 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM189 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM189 is therefore inhibition of BACE2, a GAM189 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 has been established by previous studies. Deposition in the brain of the 39- to 43- amino acid amyloid- beta peptide is a hallmark of Alzheimer disease (AD; 104300), a frequent complication of Down syndrome (OMIM Ref. No. 190685) patients after age 30 years. Amyloid- beta is generated by proteolytic processing of the amyloid precursor protein (APP; 104760) by beta- and gamma- secretase at the N and C termini, respectively. Presenilin- 1 (OMIM Ref. No. 104311) is involved in the gamma- secretase activity. BACE (OMIM Ref. No. 604252), a transmembrane aspartyl protease, possesses beta-secretase activity. By differential display RT- PCR of poorly and highly metastatic breast cancer cell lines, followed by screening a bone marrow stroma cell cDNA library, Xin et al. (2000) obtained a cDNA encoding BACE2, which they termed ALP56. Sequence analysis predicted that the 518- amino acid protein has 2 pepsin- like active centers, a signal sequence, a propeptide, and a long C- terminal

extension including a transmembrane domain. Northern blot analysis detected 2.5- and 2.0- kb transcripts in metastatic tumors injected in SCID mice (see OMIM Ref. No. 202500). In situ hybridization analysis demonstrated high expression in breast, colon, and prostate cancer biopsies, as well as in normal prostate. Northern blot analysis of normal tissue revealed expression in prostate, pancreas, and placenta. Further exposure detected expression in all tissues tested except brain and lymphocytes. Western blot analysis showed expression of a 60- kD protein as well as apparent autocleavage products of 17 and 14 kD. By searching EST databases with the BACE sequence and identifying mapped sequences, Saunders et al. (1999) identified a cDNA encoding BACE2 and mapped the gene to 21q22.2-q22.3. Using FISH, Acquati et al. (2000) confirmed the localization of BACE2 to 21q22.3, within the Down syndrome critical region.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Xin, H.; Stephans, J. C.; Duan, X.; Harrowe, G.; Kim, E.; Grieshammer, U.; Kingsley, C.; Giese, K. : Identification of a novel aspartic- like protease differentially expressed in human breast cancer cell lines. Biochim. Biophys. Acta 1501: 125- 137, 2000. ; and

Saunders, A. J.; Kim, T.- W.; Tanzi, R. E. : BACE maps to chromosome 11 and a BACE homolog, BACE2, reside in the obligate Down syndrome region of chromosome 21. Science 286: 1255A only.

Further studies establishing the function and utilities of BACE2 are found in John Hopkins OMIM database record ID 605668, and in cited publications listed in Table 9, hereby incorporated herein.

GAM189 FHL2 CATTGCACTCCAGCC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A TGGGCAA another GAM189 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM189 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM189 is therefore inhibition of FHL2, a GAM189 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 has been established by previous studies. LIM proteins contain a highly

conserved double zinc finger motif called the LIM domain. By searching sequence databases with a partial human SLIM1 (FHL1; 300163) cDNA, Morgan and Madgwick (1996) identified partial SLIM3 cDNAs. Genini et al. (1997) used subtractive cloning to isolate a gene that is downregulated during transformation of normal myoblasts to rhabdomyosarcoma cells. The gene, termed DRAL for 'down-regulated in rhabdomyosarcoma LIM protein,' encodes a 279- amino acid polypeptide with an observed mass of 32 kD. The protein sequence contains 4 complete LIM domains and the second half of a fifth LIM domain. DRAL appears to be a member of the LIM- only class of proteins, which consist primarily of LIM domains and little else. Southern blotting revealed a single- copy gene that is conserved among vertebrates. Northern blotting revealed that the DRAL gene is expressed at highest levels in heart and ovary, and at lower levels in skeletal muscle, prostate, testis, small intestine, and colon. Results of Northern blotting of tumor cell lines suggested to Genini et al. (1997) that this gene may be downregulated during transformation of a variety of cell types. Genini et al. (1997) used in situ hybridization to map the human FHL2 gene to 2q12- q14. By fluorescence in situ hybridization, Chan et al. (1998) mapped the FHL2 gene to 2q12- q13. Using the yeast 2- hybrid system, Tanahashi and Tabira (2000) screened for proteins interacting with an Alzheimer disease gene, presenilin- 2 (OMIM Ref. No. 600759), and cloned DRAL. DRAL interacted with a hydrophilic loop region (amino acids 269- 298) in the endoproteolytic N- terminal fragment of PS2, but not that of PS1 (OMIM Ref. No. 104311), although residues 269 to 298 of PS2 and the corresponding PS1 sequence differ by only 3 amino acids. Each of 9 PS2 point mutations within a region from residues 275 to 296 abolished the binding. The in vitro interaction was confirmed by affinity column assay and the physiologic interactions between endogenous PS2 and DRAL by coimmunoprecipitation from human lung fibroblast MRC5 cells. The authors suggested that DRAL functions as a link between PS2 and an intracellular signaling pathway.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Genini, M.; Schwalbe, P.; Scholl, F. A.; Remppis, A.; Mattei, M.- G.; Schafer, B. W. : Subtractive cloning and characterization of DRAL, a novel LIM- domain protein down- regulated in rhabdomyosarcoma. DNA Cell Biol. 16: 433- 442, 1997. ; and

Tanahashi, H.; Tabira, T. : Alzheimer's disease- associated presenilin 2 interacts with DRAL, an LIM- domain protein. Hum. Molec. Genet. 9: 2281- 2289, 2000.

Further studies establishing the function and utilities of FHL2 are found in John Hopkins OMIM database record ID 602633, and in

cited publications listed in Table 9, hereby incorporated herein.

GAM189 HD CATTGCACTCCAGCC HD (Accession NM_002111.3) is another GAM189 target gene. HD A A

TGGGCAA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM189 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM189 is therefore inhibition of HD. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM189 IGF1 CATTGCACTCCAGCC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

TGGGCAA NM_000618.2) is another GAM189 target gene. IGF1 BINDING SITE1 and IGF1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IGF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE1 and IGF1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM189 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM189 is therefore inhibition of IGF1, a GAM189 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM189 PRND CATTGCACTCCAGCC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

TGGGCAA another GAM189 target gene. PRND BINDING SITE1 through PRND BINDING SITE4 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE4, and secondary structure complementarity to the nucleotide sequence of GAM189 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM189 is therefore inhibition of PRND, a GAM189 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM189 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM193 APPBP2 TATTGCTAAGAATTC AGGTAGT A A Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM193 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM193 is therefore inhibition of APPBP2, a GAM193 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM193 IGF1 TATTGCTAAGAATTC AGGTAGT A A Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM193 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM193 is therefore inhibition of IGF1, a GAM193 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM193 NPY TATTGCTAAGAATTC AGGTAGT A A Neuropeptide Y (NPY, Accession NM_000905.2) is another GAM193 target gene. NPY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NPY BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM193 is therefore inhibition of NPY,

a GAM193 target gene which is implicated in the control of feeding and in the secretion of gonadotrophin- release hormone. and therefore is associated with Alzheimer. Accordingly, utilities of GAM193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NPY.The function of NPY has been established by previous studies. Hansel et al. (2001) identified a role for NPY in promoting proliferation of postnatal neuronal precursor cells. NPY is synthesized in the postnatal olfactory epithelium by sustentacular cells, previously proposed to function only in structural support. Mice with a targeted deletion of NPY contained half as many dividing olfactory neuronal precursor cells as did controls. Furthermore, NPY-deficient mice developed significantly fewer olfactory neurons by adulthood. NPY acts on multipotent neuronal precursor or basal cells to activate rapidly and transiently the extracellular signal-regulated kinase (ERK) 1/2 (OMIM Ref. No. 601795) subgroup of mitogen- activated protein kinases. The NPY Y1 receptor subtype (OMIM Ref. No. 162641) appears to mediate this effect. The ability of NPY to induce neuronal precursor proliferation is mediated by protein kinase C (PKC; 176960), indicating an upstream PKC-dependent activation of ERK1/2. These results indicate that NPY may regulate neuronal precursor proliferation in the adult mammal. Animal model experiments lend further support to the function of NPY. Neuropeptide Y is a neuromodulator implicated in the control of energy balance and is overproduced in the hypothalamus of ob/ob mice. To determine the role of NPY in the response to leptin (OMIM Ref. No. 164160) deficiency, Erickson et al. (1996) generated ob/ob mice deficient in NPY. In the absence of NPY, ob/ob mice were less obese because of reduced food intake and increased energy expenditure, and were less severely affected by diabetes, sterility, and somatotropic defects. These results were interpreted as indicating that NPY is a central effector of leptin deficiency.

It is appreciated that the abovementioned animal model for NPY is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Erickson, J. C.; Hollopeter, G.; Palmiter, R. D. : Attenuation of the obesity syndrome of ob/ob mice by the loss of neuropeptide Y. Science 274: 1704- 1706, 1996. ; and

Hansel, D. E.; Eipper, B. A.; Ronnett, G. V. : Neuropeptide Y functions as a neuroproliferative factor. Nature 410: 940- 943, 2001.

Further studies establishing the function and utilities of NPY are found in John Hopkins OMIM database record ID 162640, and in cited publications listed in Table 9, hereby incorporated herein.

GAM205 A B2M GTGGAGTTCTCTGCT AGTCCTA Beta- 2- microglobulin (B2M, Accession NM_004048.1) is a target gene. B2M BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B2M, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of B2M BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM205 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

GAM205 A target gene. A function of GAM205 is therefore inhibition of B2M, a GAM205 target gene which is the beta- chain of major histocompatibility complex class I molecules. and therefore is associated with Alzheimer. Accordingly, utilities of GAM205 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with B2M.The function of B2M has been established by previous studies. Hemodialysis- related amyloidosis (HRA) is a form of systemic amyloidosis with a predilection for the synovium and bone that occurs with a disturbingly high frequency among patients on long- term hemodialysis. The clinical features include carpal tunnel syndrome, erosive arthropathy, spondyloarthropathy, lytic bone lesions, and pathologic fractures. Gejyo et al. (1985) found that protein that accumulates in amyloid- laden tissue obtained from a chronic hemodialysis patient with carpal tunnel syndrome was identical to B2M in several characteristics. Connors et al. (1985) demonstrated the in vitro creation of amyloid fibers from B2M. Gorevic et al. (1985, 1986) reported the amino acid sequence of the HRA subunit protein and identified it as beta- 2- microglobulin. The occurrence of amyloidosis in these patients can be prevented by periodic use of high- permeability membranes or intermittent hemofiltration. Charra et al. (1984) reported that 38 of 52 patients receiving hemodialysis for more than 8 years for chronic renal failure not due to amyloid nephropathy developed carpal tunnel syndrome. Tissues excised at surgical decompression contained amyloid. In 95% of these patients, shoulder pain, which was presumed to be due to amyloid deposits, was present. McClure et al. (1986) demonstrated the beta- 2- microglobulin nature of the amyloid in the 3 patients with carpal tunnel syndrome requiring decompression surgery after long- term hemodialysis treatment for chronic renal failure not due to amyloid nephropathy. Zingraff et al. (1990) described a patient with severe renal insufficiency who had beta- 2- microglobulin amyloidosis despite the fact that dialysis had never been performed. The possibility that some B2M variants are more amyloidogenic than others should be explored. Animal model experiments lend further support to the function of B2M. The defect in hereditary hemochromatosis (HFE; 235200) resides in a gene in the class I MHC

region. This fact lends significance to the findings of de Sousa et al. (1994), who reported a comparative histologic and quantitative analysis of iron distribution in the tissues of mice homozygous and heterozygous for knockout of the beta- 2- microglobulin gene. Progressive hepatic iron overload, indistinguishable from that observed in human hemochromatosis, was found only in mice homozygous for the mutated B2M gene.

It is appreciated that the abovementioned animal model for B2M is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Gorevic, P. D.; Casey, T. T.; Stone, W. J.; DiRaimondo, C. R.; Prelli, F. C.; Frangione, B. : Beta- 2 microglobulin is an amyloidogenic protein in man. J. Clin. Invest. 76: 2425- 2429, 1985. ; and

Further studies establishing the function and utilities of B2M are found in John Hopkins OMIM database record ID 109700, and in cited publications listed in Table 9, hereby incorporated herein.

GAM205 PLCD1 GTGGAGTTCTCTGCT Phospholipase C, Delta 1 (PLCD1, Accession NM_006225.1) is A A AGTCCTA another GAM205 target gene. PLCD1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PLCD1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM205 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM205 is therefore inhibition of PLCD1, a GAM205 target gene which acts as a signal transducer that generates 2 messengers, diacylglycerol and inositol 1,4,5-trisphosphate and therefore is associated with Alzheimer. Accordingly, utilities of GAM205 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PLCD1.The function of PLCD1 has been established by previous studies. Phosphoinositide- specific phospholipase C acts as a signal transducer that generates 2 messengers, diacylglycerol and inositol 1,4,5- trisphosphate, by hydrolyzing inositol phospholipids. Molecules belonging to the PLC

family are divided into subfamilies, PLC- beta (see OMIM Ref. No. 600810), PLC- gamma (see OMIM Ref. No. 172420), and PLC- delta, whose amino acid sequences are highly conserved in 2 distinct regions designated X and Y. PLC- delta- 1 is distinguished from PLC- gamma by lack of the SH2 and SH3 domains that are essential for activation of PLC- gamma by tyrosine protein kinases, and from PLC- beta by lack of the C- terminal region of PLC- beta that is responsible for binding and activation by G proteins. Cheng et al. (1995) cloned cDNA for human PLC- delta- 1 and localized the gene to chromosome 3 by means of a human/rodent somatic cell panel (Lyu et al. 1996). In the course of a large- scale sequencing analysis of genomic DNA in the vicinity of the homozygous deletion on chromosome 3p found in a lung cancer cell line, Ishikawa et al. (1997) found that the gene encoding phospholipase C, delta- 1 (PLCD1) is located just distal to the region removed by the deletion. They found that the gene consists of 15 exons and spans about 22 kb. By fluorescence in situ hybridization, they localized the PLCD1 gene to 3p22- p21.3. Shimohama et al. (1998) examined the entire sequences corresponding to protein- coding exons 2- 15 of the hamster PLC- delta- 1 gene in genomic DNA derived from the leukocytes of 13 unrelated patients with early- onset sporadic Alzheimer disease (OMIM Ref. No. 104300). In 1 of these patients whose clinical features and course did not differ from those of the other 12 cases, they found a change of codon CGC (arg) to CAC (his), located in the pleckstrin homology domain of the PLCD1 gene. They stated that this was the first mutation found in the human PLC genes. Site- directed mutagenesis of the glutathione- S- transferase (GST/PLCD1) fusion protein changing arg105 to his resulted in a 4- fold decrease in the affinity of specific binding and a reduction in hydrolyzing activity to about 40% of that of the wildtype enzyme. This remarkable loss of function could be interpreted in terms of a conformational change in the pleckstrin homology domain. Shimohama et al. (1998) found that the arg105- to- his mutation was present in heterozygous state in the patient with AD. The mutation was not found in DNA extracted from leukocytes of 23 unrelated patients with familial AD, 23 unrelated patients with early- onset sporadic AD, 46 unrelated patients with late- onset sporadic AD, and 456 nondemented control subjects. Thus the change did not appear to be a common polymorphism. However, determination of the possible pathologic role required transgenic studies of the mutant gene to determine the role of the enzyme and the mutation and a search for other mutations in the pleckstrin homology domain of PLC genes in human subjects with genetic disorders. They pointed out that mutations in the pleckstrin homology domain of the BTK gene occur in patients with Bruton agammaglobulinemia (OMIM Ref. No. 300300).

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Cheng, H. F.; Jiang, M. J.; Chen, C. L.; Liu, S. M.; Wong, L. P.; Lomasney, J. W.; King, K. : Cloning and identification of amino acid residues of human phospholipase C delta 1 essential for catalysis. J. Biol. Chem. 270: 5495- 5505, 1995. ; and

Further studies establishing the function and utilities of PLCD1 are found in John Hopkins OMIM database record ID 602142, and in cited publications listed in Table 9, hereby incorporated herein.

GAM206 MME TGCACTTGTCTTTAC CCTAGAG Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_000902.2) is a GAM206 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM206 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM206 is therefore inhibition of MME, a GAM206 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM206 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM206 HD TTTCTGGAGGGCAAG TGCAGGG HD (Accession NM_002111.3) is another GAM206 target gene. HD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM206 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM206 is therefore inhibition of HD. Accordingly, utilities of GAM206 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM240 MME TGGCACATAGTAAGT GTTCAGT Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_007287.1) is a GAM240 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the A A

nucleotide sequence of GAM240 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM240 is therefore inhibition of MME, a GAM240 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM240 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM240	DLST	ATCACTATTAATGTG TGCTAGT	Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM240 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM240 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	B	A

Another function of GAM240 is therefore inhibition of DLST, a GAM240 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM240 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST has been established by previous studies. The alpha- keto acid dehydrogenase complexes (pyruvate dehydrogenase complex, alpha-ketoglutarate dehydrogenase complex, and branched chain alpha- keto acid dehydrogenase complex) are a family of multienzyme complexes. They are localized in mitochondria and catalyze the oxidative decarboxylation of alpha- keto acids. These 3 alpha- keto acid dehydrogenase complexes are composed of 3 different enzymes: alpha-keto acid dehydrogenase (E1), dihydrolipoamide acyltransferase (E2), and dihydrolipoamide dehydrogenase (E3). Dihydrolipoamide succinyltransferase, which is a component of the structural core of the alpha- keto glutarate dehydrogenase complex, was studied by Nakano et al. (1993), who isolated a cDNA from a human fibroblast cDNA library. They found that the DLST gene contains 3 exons and 4 introns and that the nucleotide sequence at the 5- prime donor and 3- prime acceptor sites of all introns conformed to the gt- ag rule. Amino acid sequences of the 3 exons supported their previous observation (Nakano et al. 1993) that human dihydrolipoamide succinyltransferase lacks a sequence motif for an E1 (OMIM Ref. No. 312170) and/or E3 (OMIM Ref. No. 246900) binding site. By fluorescence in situ hybridization, they found that the DLST gene is located on 14q24.2- q24.3 and that a related sequence is located on 1p31. The gene for the dihydrolipoamide acyltransferase of the branched chain alpha- keto acid dehydrogenase complex (DBT; 248610),

the site of the mutation in type 2 maple syrup urine disease, is located on 1p31. Nakano et al. (1993) mentioned the possibility that mutation of the DLST gene may be a cause of familial Alzheimer disease that maps to 14q24.3 (AD3; 104311). Ali et al. (1994) mapped the DLST gene (symbolized by them KGDHC) to 14q24.3 by isotopic in situ hybridization. The cDNA they used also cross- hybridized to an apparent E2k pseudogene on 1p31. Northern analysis demonstrated that the gene is ubiquitously expressed in peripheral tissues and brain. Ali et al. (1994) mentioned Machado- Joseph disease as another candidate for mutation in the DLST gene. DLST is the E2 component of the alpha- ketoglutarate dehydrogenase complex. In contrast to the E2 components of the other 2 alpha- keto acid dehydrogenase complexes, the pyruvate dehydrogenase complex, and the branched-chain alpha- keto acid dehydrogenase complex, the alpha- KGDC E2 has a unique structure consisting of 2 domains and lacking a sequence motif of an E3 and/or E1 binding site (Patel and Harris, 1995).

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Nakano, K.; Takase, C.; Sakamoto, T.; Ohta, S.; Nakagawa, S.; Ariyama, T.; Inazawa, J.; Abe, T.; Matuda, S. : An unspliced cDNA for human dihydrolipoamide succinyltransferase: characterization and mapping of the gene to chromosome 14q24.2- q24.3. Biochem. Biophys. Res. Commun. 196: 527- 533, 1993. ; and

Patel, M. S.; Harris, R. A. : Mammalian alpha- keto acid dehydrogenase complexes: gene regulation and genetic defects. FASEB J. 9: 1164- 1172, 1995.

Further studies establishing the function and utilities of DLST are found in John Hopkins OMIM database record ID 126063, and in cited publications listed in Table 9, hereby incorporated herein.

GAM259 HD GTCAGCAAGGAGGGG HD (Accession NM_002111.3) is a GAM259 target gene. HD BINDING A A
TGGACAA SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM259 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM259 is therefore inhibition of HD. Accordingly, utilities of GAM259 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM269 APPBP2 CATTGCACTCCAGCC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
TGGGTGA Protein 2 (APPBP2, Accession NM_006380.2) is a GAM269 target gene. APPBP2 BINDING SITE is a target binding site found in the 3`

untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM269 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM269 is therefore inhibition of APPBP2, a GAM269 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM269 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM269 FHL2 CATTGCACTCCAGCC A A TGGGTGA Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is another GAM269 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM269 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM269 is therefore inhibition of FHL2, a GAM269 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM269 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM269 IGF1 CATTGCACTCCAGCC A A TGGGTGA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM269 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM269 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM269 is therefore inhibition of IGF1, a GAM269 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM269 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with

IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM269 PRND CATTGCACTCCAGCC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM269 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM269 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

TGGGTGA

Another function of GAM269 is therefore inhibition of PRND, a GAM269 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM269 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM269 TNFRSF5 CATTGCACTCCAGCC TNFRSF5 (Accession NM_152854.1) is another GAM269 target gene. A A

TGGGTGA TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM269 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM269 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM269 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM270 SNCA AAGGTAGATAAAGGC SNCA (Accession NM_000345.2) is a GAM270 target gene. SNCA A A

TTCACGT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM270 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM270 is therefore inhibition of SNCA. Accordingly, utilities of GAM270 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical

conditions associated with SNCA.

GAM281 APPBP2 CACTGCACTCCAGCC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
TGGGCAA Protein 2 (APPBP2, Accession NM_006380.2) is a GAM281 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM281 is therefore inhibition of APPBP2, a GAM281 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM281 BACE2 CACTGCACTCCAGCC Beta- site APP- cleaving Enzyme 2 (BACE2, Accession A A
TGGGCAA NM_138991.1) is another GAM281 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of BACE2, a GAM281 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM281 BCHE CACTGCACTCCAGCC BCHE (Accession NM_000055.1) is another GAM281 target gene.
A A
TGGGCAA BCHE BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BCHE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BCHE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of

BCHE. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BCHE.

GAM281 A A CTSB TGGGCAA CACTGCACTCCAGCC CTSB (Accession NM_147780.1) is another GAM281 target gene. CTSB BINDING SITE1 and CTSB BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CTSB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE1 and CTSB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of CTSB. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM281 A A CTSK TGGGCAA CACTGCACTCCAGCC CTSK (Accession NM_000396.2) is another GAM281 target gene. CTSK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSK BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of CTSK. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSK.

GAM281 A A FHL2 TGGGCAA CACTGCACTCCAGCC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is another GAM281 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of FHL2, a GAM281 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been

established by previous studies, as described hereinabove with reference to GAM189.

GAM281 HD CACTGCACTCCAGCC HD (Accession NM_002111.3) is another GAM281 target gene. HD A A
TGGGCAA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of HD. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM281 IGF1 CACTGCACTCCAGCC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
TGGGCAA NM_000618.2) is another GAM281 target gene. IGF1 BINDING SITE1 and IGF1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IGF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE1 and IGF1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of IGF1, a GAM281 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM281 IL1A CACTGCACTCCAGCC Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another A A
TGGGCAA GAM281 target gene. IL1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of IL1A, a GAM281 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A has

been established by previous studies. There are 2 structurally distinct forms of IL1: IL1(alpha), which is the acidic form with pI5, and IL1(beta) (IL1B; 147720), the neutral form with pI7. Both are 17- kD proteins coded by separate genes. The IL1A gene has 10,206 bp with 7 exons and 6 introns (Furutani et al. 1986). By Southern transfer analysis of DNAs from human- rodent somatic cell hybrids, Modi et al. (1988) assigned the IL1A gene to chromosome 2. Regional localization to 2q13- q21 was achieved by in situ hybridization. Lafage et al. (1989) confirmed assignment to 2q13 by in situ hybridization. The IL1A and IL1B proteins, which are synthesized by a variety of cell types including activated macrophages, keratinocytes, stimulated B lymphocytes, and fibroblasts, are potent mediators of inflammation and immunity. Lord et al. (1991) demonstrated that both the alpha and beta forms, but particularly the beta form, are transcribed in polymorphonuclear leukocytes stimulated with LPS. Both IL1A and IL1B stimulate osteoclast activity in vitro and are potent bone resorbing factors. Sabatino et al. (1988) studied the effects of 72- hour subcutaneous infusions of interleukins 1- alpha and - beta on plasma, calcium, and bone morphology. Both interleukins 1 caused a marked, dose-dependent increase in plasma calcium. Increased numbers of osteoclasts and bone resorption surfaces were observed on quantitative histomorphometry of bone. The results suggest a role for IL1 in the modulation of extracellular fluid calcium homeostasis. Hogquist et al. (1991) demonstrated that interleukin- 1 is involved in apoptosis (cell death). Both the alpha and the beta forms are released as a consequence of cell injury regardless of the insult Ki et al. (2001) analyzed the IL1A - 889 C/T genotype of 126 Korean patients with AD and found no significant difference in allele frequencies between patients and controls. Interestingly, there were no T/T homozygotes in the entire study population

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Hogquist, K. A.; Nett, M. A.; Unanue, E. R.; Chaplin, D. D. : Interleukin 1 is processed and released during apoptosis. Proc. Nat. Acad. Sci. 88: 8485- 8489, 1991. ; and

Ki, C.- S.; Na, D. L.; Kim, D. K.; Kim, H. J.; Kim, J.- W. : Lack of association of the interleukin- 1- alpha gene polymorphism with Alzheimer's disease in a Korean population. (Letter) Ann.

Further studies establishing the function and utilities of IL1A are found in John Hopkins OMIM database record ID 147760, and in cited publications listed in Table 9, hereby incorporated herein.

GAM281 A NGB A CACTGCACTCCAGCC TGGGCAA Neuroglobin (NGB, Accession NM_021257.2) is another GAM281 target gene. NGB BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of NGB, a GAM281 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB has been established by previous studies. By EST database searching for globin- like sequences, Burmester et al. (2000) identified cDNAs encoding human and mouse neuroglobin, symbolized NGB. Sequence analysis predicted that the 151- amino acid mouse and human proteins share 94% identity with each other but less than 25% identity with other vertebrate globins. RNA dot blot analysis revealed predominant expression in the brain, with strongest signals observed in the frontal lobe, the subthalamic nucleus, and the thalamus. In situ hybridization analysis demonstrated expression in mouse brain neuronal cells. RT- PCR detected only trace amounts of Ngb in other mouse tissues. Biochemical purification and size- exclusion chromatographic analysis showed that Ngb is a 16- kD monomer, found in low concentrations in mouse brain, that reversibly binds oxygen with an affinity nearly as high as that of MB but higher than that of HB. Genomic sequence analysis of a PAC clone determined that the NGB gene has a 4 exon/3 intron structure, distinct from that of other globin genes, and a promoter region that contains several putative SP1 (OMIM Ref. No. 189906)- binding sites. Five- prime RACE identified at least 3 transcription starting points but no TATA box, suggesting a housekeeping promoter. In an accompanying editorial, Moens and Dewilde (2000) noted that regions of the brain with lower expression of NGB (e.g. hippocampus) have lower resistance to ischemia and are frequently affected by neurofibrillary tangles in Alzheimer disease.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Burmester, T.; Weich, B.; Reinhardt, S.; Hankeln, T. : A vertebrate globin expressed in the brain. Nature 407: 520- 523, 2000. ; and

Moens, L.; Dewilde, S. : Globins in the brain. Nature 407: 461- 462, 2000.

Further studies establishing the function and utilities of NGB

are found in John Hopkins OMIM database record ID 605304, and in cited publications listed in Table 9, hereby incorporated herein.

GAM281 PRND CACTGCACTCCAGCC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A TGGGCAA another GAM281 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM281 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM281 is therefore inhibition of PRND, a GAM281 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM281 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM282 APLP1 TGAGAGAGCAAGTGA Amyloid Beta (A4) Precursor- like Protein 1 (APLP1, Accession A A ATTTCCC NM_005166.2) is a GAM282 target gene. APLP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM282 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM282 is therefore inhibition of APLP1, a GAM282 target gene which is a membrane- associated glycoprotein and therefore is associated with Alzheimer. Accordingly, utilities of GAM282 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP1.The function of APLP1 has been established by previous studies. Wasco et al. (1992) isolated a cDNA from a mouse brain library that encodes a protein whose predicted amino acid sequence is 42% identical and 64% similar to that of the amyloid beta protein precursor (APP; 104760). This 653- amino acid amyloid precursor- like protein (APLP) was also similar to APP in overall structure. Wasco et al. (1993) studied a panel of DNAs from human/rodent somatic cell lines to determine that the APLP locus is located on chromosome 19. Further study of somatic cell hybrids containing parts of chromosome 19 excluded the short arm of chromosome 19 as the site of APLP and placed it between the centromere and 19q13.2. The finding was of interest because of the existence of some families with late- onset (more than 65 years of age) Alzheimer disease that mapped to chromosome 19 and the fact that at least some families with Alzheimer disease have a mutation

in the APP gene on chromosome 21. Lenkkeri et al. (1998) determined the entire sequence of human APLP1 from a cosmid clone. The gene is 11.8 kb long and contains 17 exons. Since congenital nephrotic syndrome (CNF; 256300) maps close to APLP1, and because of the proposed interference of amyloid with basement membrane assembly, APLP1 had been considered a candidate gene for CNF. Lenkkeri et al. (1998) amplified all exon regions of the APLP1 gene by PCR and sequenced them from DNA of CNF patients. No differences were observed between CNF patients and controls, suggesting that mutations in APLP1 are not involved in the etiology of CNF.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Lenkkeri, U.; Kestila, M.; Lamerdin, J.; McCready, P.; Adamson, A.; Olsen, A.; Tryggvason, K. : Structure of the human amyloid-precursor- like protein gene APLP1 at 19q13.1. Hum. Genet. 102: 192-196, 1998. ; and

Wasco, W.; Brook, J. D.; Tanzi, R. E. : The amyloid precursor-like protein (APLP) gene maps to the long arm of human chromosome 19. Genomics 15: 237- 239, 1993.

Further studies establishing the function and utilities of APLP1 are found in John Hopkins OMIM database record ID 104775, and in cited publications listed in Table 9, hereby incorporated herein.

GAM282 A NPY A TGAGAGAGCAAGTGA ATTTCCC Neuropeptide Y (NPY, Accession NM_000905.2) is another GAM282 target gene. NPY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NPY BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM282 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM282 is therefore inhibition of NPY, a GAM282 target gene which is implicated in the control of feeding and in the secretion of gonadotrophin- release hormone. and therefore is associated with Alzheimer. Accordingly, utilities of GAM282 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NPY.The function of NPY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM193.

GAM282 A APBB2 A CTGGCTCTACCCTCT CACTTCA Amyloid Beta (A4) Precursor Protein- binding, Family B, Member B (Fe65- (APBB2, Accession NM_173075.1) is another GAM282 target gene. APBB2 BINDING SITE is a target binding site found in the 5`

untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM282 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM282 is therefore inhibition of APBB2, a GAM282 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM282 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM282 PLAU CTGGCTCTACCCTCT Plasminogen Activator, Urokinase (PLAU, Accession NM_002658.1)
B A

CACTTCA is another GAM282 target gene. PLAU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLAU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PLAU BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM282 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM282 is therefore inhibition of PLAU, a GAM282 target gene which is an urokinase plasminogen activator and serine protease . and therefore is associated with Alzheimer. Accordingly, utilities of GAM282 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PLAU.The function of PLAU has been established by previous studies. Urokinase is the urinary plasminogen activator (uPA; EC 3.4.2.73). (Tissue plasminogen activator, 173370, is a second type; it has a single polypeptide chain of 70,000 daltons and is unrelated to urokinase immunologically.) Urokinase is a protein that has a molecular weight of about 54,000 daltons and is composed of 2 disulfide- linked chains, A and B, of molecular weights 18,000 and 33,000, respectively. Salerno et al. (1984) developed separate monoclonal antibodies for the A and B chains and by using them identified a single- chain biosynthetic precursor in a rabbit reticulocyte cell-free protein- synthesizing system directed by human kidney total polyadenylated RNA. Thus, the precursor must be cleaved in a way that the insulin precursor is cleaved. By combined somatic cell genetics, in situ hybridization, and Southern hybridization, Tripputi et al. (1985) localized the human urokinase gene to 10q24-qter. By use of specific cDNA probes in the study of human- mouse somatic cell hybrids, Rajput et al. (1985) mapped the human tissue plasminogen activator and urokinase genes to chromosomes 8 and 10,

respectively. By Southern blot analysis of DNA from mouse- Chinese hamster and mouse- rat somatic cell hybrids, Rajput et al. (1987) assigned the mouse equivalent (Plau) to mouse chromosome 14. Ahmed et al. (2001) stated that PLAU is 1 of 3 genes that are nested in the introns of PCDH15 (OMIM Ref. No. 605514), which maps to 10q21-q22. Animal model experiments lend further support to the function of PLAU. Rijneveld et al. (2002) generated mice deficient in Upa or Upar. Intranasal exposure to a beta- 2 integrin- dependent pathogen, Streptococcus pneumoniae, resulted in locally elevated levels of Upa in wildtype mouse lungs. In Upar - /- mice, there was less granulocyte accumulation but more bacteria in lungs, as well as reduced survival, compared with wildtype mice.

It is appreciated that the abovementioned animal model for PLAU is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Salerno, G.; Verde, P.; Nolli, M. L.; Corti, A.; Szots, H.; Meo, T.; Johnson, J.; Bullock, S.; Cassani, G.; Blasi, F. : Monoclonal antibodies to human urokinase identify the single- chain pro- urokinase precursor. Proc. Nat. Acad. Sci. 81: 110- 114, 1984. ; and

Tripputi, P.; Blasi, F.; Verde, P.; Cannizzaro, L. A.; Emanuel, B. S.; Croce, C. M. : Human urokinase gene is located on the long arm of chromosome 10. Proc. Nat. Acad. Sci. 82: 4448- 44.

Further studies establishing the function and utilities of PLAU are found in John Hopkins OMIM database record ID 191840, and in cited publications listed in Table 9, hereby incorporated herein.

GAM291 APBB2 AGATAGTTCTCTGTT Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

GTTGGGG 2 (Fe65- (APBB2, Accession NM_173075.1) is a GAM291 target gene. APBB2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM291 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM291 is therefore inhibition of APBB2, a GAM291 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM291 include diagnosis, prevention and

treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM291 FHL2 AGATAGTTCTCTGTT Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A GTTGGGG another GAM291 target gene. FHL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM291 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM291 is therefore inhibition of FHL2, a GAM291 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM291 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM291 PRND AGATAGTTCTCTGTT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A GTTGGGG another GAM291 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM291 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM291 is therefore inhibition of PRND, a GAM291 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM291 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM291 TNFSF5 AGATAGTTCTCTGTT TNFSF5 (Accession NM_000074.1) is another GAM291 target gene. A A GTTGGGG TNFSF5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFSF5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM291 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM291 is therefore inhibition of TNFSF5. Accordingly, utilities of GAM291 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFSF5.

GAM317 ADAM17 TAGGAAGTATTTTTT A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A

AAAAACA factor, (ADAM17, Accession NM_021832.1) is a GAM317 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM317 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM317 is therefore inhibition of ADAM17, a GAM317 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM317 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 has been established by previous studies. Black et al. (1997) cloned a human cDNA encoding ADAM17, which they called TACE. The gene encodes an 824- amino acid polypeptide containing the features of the ADAM family: a secretory signal sequence, a disintegrin domain, and a metalloprotease domain. Expression studies showed that the encoded protein cleaves precursor tumor necrosis factor- alpha (TNFA; 191160) to its mature form. Northern blot analysis revealed that the gene was expressed as a 5- kb mRNA in all tissues examined. Black et al. (1997) generated mouse T cells with a homozygous deficiency in the TACE gene; these cells showed an 80 to 90% reduction in the release of TNFA. Yamazaki et al. (1998) used PCR of a backcross panel to map the mouse Tace gene to the proximal arm of chromosome 12. Hirohata et al. (1998) used radiation hybrids to map ADAM17 to human chromosome 2p25. Animal model experiments lend further support to the function of ADAM17. Peschon et al. (1998) found that mice lacking the zinc- binding domain of Tace died in utero after embryonic day 17.5 or failed to survive beyond 1 week of age.

It is appreciated that the abovementioned animal model for ADAM17 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Black, R. A.; Rauch, C. T.; Kozlosky, C. J.; Peschon, J. J.;

Slack, J. L.; Wolfson, M. F.; Castner, B. J.; Stocking, K. L.; Reddy, P.; Srinivasan, S.; Nelson, N.; Boiani, N.; Schooley, K. A.; Gerhart, M.; Davis, R.; Fitzner, J. N.; Johnson, R. S.; Paxton, R. J.; March, C. J.; Cerretti, D. P. : A metalloproteinase disintegrin that releases tumour- necrosis factor- alpha from cells. Nature 385: 729- 733, 1997. ; and

Peschon, J. J.; Slack, J. L.; Reddy, P.; Stocking, K. L.; Sunnarborg, S. W.; Lee, D. C.; Russell, W. E.; Castner, B. J.; Johnson, R. S.; Fitzner, J. N.; Boyce, R. W.; Nelson, N.; Kozlosk.

Further studies establishing the function and utilities of ADAM17 are found in John Hopkins OMIM database record ID 603639, and in cited publications listed in Table 9, hereby incorporated herein.

GAM317 APPBP2 TAGGAAGTATTTTTT AAAAAACA Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is another GAM317 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM317 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM317 is therefore inhibition of APPBP2, a GAM317 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM317 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM317 GYPA TAGGAAGTATTTTTT AAAAAACA Glycophorin A (includes MN blood group) (GYPA, Accession NM_002099.2) is another GAM317 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM317 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM317 is therefore inhibition of GYPA, a GAM317 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM317 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA has been established by previous studies. On the basis of studies in the family of a child with a translocation chromosome, German et al. (1968) suggested that the MN

locus is either in the middle of chromosome 2 or near the distal end of the long arm of chromosome 4. Using 'banding techniques,' German and Chaganti (1973) restudied the translocation they reported in 1968 and concluded that MN can be tentatively assigned to the area of band q14 in the proximal portion of the long arm of chromosome 2. Weitkamp et al. (1972) presented data suggesting that the MN locus and the beta hemoglobin locus (OMIM Ref. No. 141900) are linked. (This has, of course, been disproved.) Barbosa et al. (1975) excluded a recombination fraction of less than 0.30 for MN and Hb beta. The results supported a lower recombination fraction for males. Linkage with the Alzheimer locus (OMIM Ref. No. 104300) and with colonic polyposis (OMIM Ref. No. 175100) has been suspected. Recombination data suggested that the MN and acid phosphatase (ACP1; 171500) loci are far apart (Weitkamp et al. 1975). Cook et al. (1978) excluded MNSs from chromosome 9 by exclusion mapping that incorporated data both from families with chromosome markers and from linkage studies with firmly assigned markers. MNSs was subsequently assigned to chromosome 4. In a further study of the propositus of the 2q;4q translocation family, German et al. (1979) showed by banding that the breaks had occurred at 2q14 and 4q29 and that a minute segment had been lost at the site of break. Whether the loss was from chromosome 2 or 4 was not certain because both have several short bands at these sites and only one band was missing in the proband. The proband lacked blood type 's' (GPB; 111740) which he should have received from his 'ss' father, had signs of a modified red cell membrane, and had developmental abnormalities. Since the abnormalities of phenotype appeared at the same time as the chromosomal abnormality, German et al. (1979) suggested that deletion was the basis of all the changes. Since Weitkamp (1978) reported observations indicating strongly that MNSs is not near 2q14, German et al. (1979) concluded that it must be in a band near 4q29. Cook et al. (1980) favored 4q28 over 4q31. For males, Bias and Meyers (1979) found a maximal lod score of 3.99 at theta 0.18 for linkage of Stoltzfus (OMIM Ref. No. 111800) and MNS. Acid phosphatase and Kidd both gave lods of 0.32 with Stoltzfus at a male- theta of 0.20. Linkage of Gc and MNSs at recombination frequencies of less than 25% in males and 30% in females was excluded by Weitkamp (1978). For MN versus Gc, Falk et al. (1979) found a male lod score of 3.75 at a recombination fraction of 0.30. In females the maximal lod score was 0.34 at a recombination fraction of 0.42. From analysis of MNSs blood groups in families with chromosome 4 rearrangements, both deletion analysis and family linkage study, Cook et al. (1981) concluded that the MNSs 'locus' lies in the region 4q28- q31. Red cells with the rare En(a-) variant are resistant to falciparum malaria (Pasvol et al. 1982). Such cells lack glycophorin A, the major red cell sialoglycoprotein (Siebert and Fukuda, 1986). The rare U(-) variant of the Ss system, which lacks the other major sialoglycoprotein, glycophorin B, is relatively resistant to invasion. Wr(b)- negative cells are also resistant to invasion by P. falciparum despite the fact that they

have normal amounts of glycophorins A and B on their surface. All of these observations, as well as experiments using antibodies to glycophorins and certain sugars, particularly N- acetylglucosamine, have led to a tentative model of the role of glycophorin in the red cell invasion of P. falciparum (Pasvol and Wilson, 1982). Langlois et al. (1986) studied the frequency of red cells with loss of expression at the glycophorin A locus (GPA). Glycophorin A is present in about 500,000 copies per red cell. The 2 allelic forms of GPA, blood group M and blood group N, are identical except for 2 amino acid substitutions at positions 1 and 5 from the amino terminus (Prohaska et al. 1986). Using monoclonal antibodies, Langlois et al. (1986) identified expression loss mutants. They found a frequency of about 1 in 100,000 cells in normals and a significant increase in the variant cells in cancer patients after exposure to mutagenic chemotherapy drugs. Langlois et al. (1987) demonstrated a linear relationship between frequency of mutations at the glycophorin A locus and radiation exposure in atomic bomb survivors. Grant and Bigbee (1994) discussed the use of the GPA assay to evaluate the creation of somatic mutations by cancer chemotherapy.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Grant, S. G.; Bigbee, W. L. : Bone marrow somatic mutation after genotoxic cancer therapy. (Letter) Lancet 343: 1507- 1508, 1994. ; and

Cook, P. J. L.; Lindenbaum, R. H.; Salonen, R.; de la Chapelle, A.; Daker, M. G.; Buckton, K. E.; Noades, J. E.; Tippett, P. : The MNSs blood groups of families with chromosome 4 rearran.

Further studies establishing the function and utilities of GYPA are found in John Hopkins OMIM database record ID 111300, and in cited publications listed in Table 9, hereby incorporated herein.

GAM317 IL1A TAGGAAGTATTTTTT AAAAACA Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another GAM317 target gene. IL1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM317 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM317 is therefore inhibition of IL1A, a GAM317 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM317 include diagnosis,

prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM329 APPBP2 TCATAAACTGGCAAG CACTACC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM329 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM329 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM329 is therefore inhibition of APPBP2, a GAM329 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM329 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM329 MAPK10 TCATAAACTGGCAAG CACTACC Mitogen- activated Protein Kinase 10 (MAPK10, Accession NM_138980.1) is another GAM329 target gene. MAPK10 BINDING SITE1 and MAPK10 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MAPK10, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE1 and MAPK10 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM329 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM329 is therefore inhibition of MAPK10, a GAM329 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM329 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM330 FHL2 ACTGCACTCCAGCCT GGGTGAC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is a GAM330 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, A A

BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM330 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM330 is therefore inhibition of FHL2, a GAM330 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM330 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM330 IGF1 ACTGCACTCCAGCCT GGGTGAC — Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM330 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM330 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM330 is therefore inhibition of IGF1, a GAM330 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM330 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM330 PRND ACTGCACTCCAGCCT GGGTGAC — Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM330 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM330 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM330 is therefore inhibition of PRND, a GAM330 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM330 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to GAM44.

GAM335 CHAT CCCCAGTCAATGCTT Choline Acetyltransferase (CHAT, Accession NM_020549.2) is a A A

CTCTCCA GAM335 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM335 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM335 is therefore inhibition of CHAT, a GAM335 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM335 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT has been established by previous studies. Cholinergic systems are implicated in numerous neurologic functions. Alteration in some cholinergic neurons may account for the disturbances of Alzheimer disease. Cholinergic neurons are best characterized by the enzyme choline acetyltransferase (CHAT; EC 2.3.1.6), which catalyzes the biosynthesis of acetylcholine. Barrard et al. (1987) isolated a cDNA clone encoding the complete sequence of porcine CHAT. By use of this clone in the study of DNA from a panel of human- rodent somatic cell hybrids, Cohen- Haguenauer et al. (1990) demonstrated that the CHAT gene is located on human chromosome 10. Strauss et al. (1991) confirmed the mapping to chromosome 10 and regionalized the assignment to 10q11- q22.2 by in situ hybridization. Viegas-Pequignot et al. (1991) used a human choline acetyltransferase genomic sequence and in situ hybridization studies to sublocalize the gene to human chromosome 10q11.2. Toussaint et al. (1992) isolated and partially sequenced a human CHAT genomic clone. The fragment they studied contained the first 4 exons with an AUG initiator codon and potential control regions including TATA, CAAT, GC boxes, and several transcription control sequences. By analyzing cDNAs from mouse spinal cord, Misawa et al. (1992) demonstrated 7 polymorphic forms of CHAT resulting from the alternative splicing of 3 5- prime exons named R, N, and M to exon 1 which contains the ATG initiation codon. Chireux et al. (1995) identified 2 alternative first exons in human choline acetyltransferase. They found regions homologous to rodent exons R and M but found that rodent exon N was not conserved in the human gene. Mutations in genes encoding choline acetyltransferase affecting motility have been described in C. elegans and Drosophila. Ohno et al. (2001) described the first mutations in human CHAT. The mutations were identified in a congenital myasthenic syndrome associated with frequently fatal episodes of apnea (CMS- EA, or FIMG; 254210). Studies of the neuromuscular junction in this disorder showed a stimulation-dependent decrease of the amplitude of the miniature endplate

potential and no deficiency of the acetylcholine receptor. These findings pointed to a defect in acetylcholine resynthesis or vesicular filling and to CHAT as one of the candidate genes. Direct sequencing of CHAT demonstrated 10 recessive mutations in 5 patients with FIMG. One mutation was a frameshifting null mutation: 523insCC (118490.0001). Three missense mutations, I305T (118490.0009), R420C (118490.0010), and E441K (118490.0003), markedly reduced CHAT expression in COS cells. Kinetic studies of 9 bacterially expressed CHAT mutants demonstrated that 1 mutant, E441K, lacked catalytic activity, and 8 mutants had significantly impaired catalytic efficiencies. The 5 patients in whom Ohno et al. (2001) demonstrated mutations of the CHAT gene ranged from age 4 to age 40 at the time of report. Four were male and 1 female. All had myasthenic symptoms since birth or early infancy, negative tests for anti- AChR antibodies, and abrupt episodic crises with increased weakness, bulbar paralysis, and apnea precipitated by undue exertion, fever, or excitement. One of the patients had 3 affected sibs and another had 2; 3 of the 5 affected sibs died during febrile episodes, and 1 died suddenly without apparent cause

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Ohno, K.; Tsujino, A.; Brengman, J. M.; Harper, C. M.; Bajzer, Z.; Udd, B.; Beyring, R.; Robb, S.; Kirkham, F. J.; Engel, A. G. : Choline acetyltransferase mutations cause myasthenic syndrome associated with episodic apnea in humans. Proc. Nat. Acad. Sci. 98: 2017- 2022, 2001. ; and

Misawa, H.; Ishii, K.; Deguchi, T. : Gene expression of mouse choline acetyltransferase: alternative splicing and identification of a highly active promoter region. J. Biol. Chem. 267:.

Further studies establishing the function and utilities of CHAT are found in John Hopkins OMIM database record ID 118490, and in cited publications listed in Table 9, hereby incorporated herein.

GAM335 DLST CCCCAGTCAATGCTT CTCTCCA A A Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM335 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM335 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM335 is therefore inhibition of DLST, a GAM335 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated

with Alzheimer. Accordingly, utilities of GAM335 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM335 TNFRSF5 CCCCAGTCAATGCTT TNFRSF5 (Accession NM_152854.1) is another GAM335 target gene. A A

CTCTCCA TNFRSF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM335 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM335 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM335 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM335 TRPM2 CCCCAGTCAATGCTT TRPM2 (Accession NM_003307.1) is another GAM335 target gene. A A

CTCTCCA TRPM2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM335 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM335 is therefore inhibition of TRPM2, a GAM335 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM335 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 has been established by previous studies. Perraud et al. (2001) demonstrated that a 350- amino acid protein, designated NUDT9 (OMIM Ref. No. 606022), and a homologous domain (NUDT9 homology domain) near the C terminus of the LTRPC2 putative cation channel both function as specific ADP- ribose pyrophosphatases. Whole- cell and single- channel analysis of HEK293 cells expressing LTRPC2 showed that LTRPC2 functions as a calcium-permeable cation channel that is specifically gated by free ADP-ribose. The expression of native LTRPC2 transcripts is detectable in many tissues, including the U937 monocyte cell line, in which ADP-ribose induces large cation currents that closely match those mediated by recombinant LTRPC2. Perraud et al. (2001) concluded that intracellular ADP- ribose regulates calcium entry into cells that express LTRPC2. Hara et al. (2002) reported that LTRPC2 is activated by micromolar levels of H2O2 and agents that produce reactive

oxygen/nitrogen species. This sensitivity of LTRPC2 to redox state modifiers was attributable to an agonistic binding of beta-nicotinamide adenine dinucleotide to the MutT motif. Arachidonic acid and calcium were important positive regulators for LTRPC2. Heterologous LTRPC2 expression conferred susceptibility to death on HEK cells. Antisense oligonucleotide experiments revealed physiologic involvement of native LTRPC2 in H2O2- and TNF- alpha (OMIM Ref. No. 191160)- induced calcium influx and cell death. Thus, LTRPC2 represents an important intrinsic mechanism that mediates calcium and sodium overload in response to disturbance of redox state in cell death.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Perraud, A.- L.; Fleig, A.; Dunn, C. A.; Bagley, L. A.; Launay, P.; Schmitz, C.; Stokes, A. J.; Zhu, Q.; Bessman, M. J.; Penner, R.; Kinet, J.- P.; Scharenberg, A. M. : ADP- ribose gating of the calcium- permeable LTRPC2 channel revealed by Nudix motif homology. Nature 411: 595- 599, 2001. ; and

Hara, Y.; Wakamori, M.; Ishii, M.; Maeno, E.; Nishida, M.; Yoshida, T.; Yamada, H.; Shimizu, S.; Mori, E.; Kudoh, J.; Shimizu, S.; Kurose, H.; Okada, Y.; Imoto, K.; Mori, Y. : LTRPC2 Ca(2 .

Further studies establishing the function and utilities of TRPM2 are found in John Hopkins OMIM database record ID 603749, and in cited publications listed in Table 9, hereby incorporated herein.

GAM347 IAPP TCATTGCAACCTCCA CCTCCTG Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is a GAM347 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM347 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM347 is therefore inhibition of IAPP, a GAM347 target gene which selectively inhibits insulin- stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM347 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP has been established by previous studies. IAPP has cysteine residues in positions 2 and 7, a feature found in all known calcitonin gene- related peptides (OMIM Ref. No. 114130). IAPP shows 46% amino acid sequence homology with CGRP II (OMIM Ref. No. 114160). Since IAPP has been demonstrated immunochemically in normal beta cells of several mammals, it probably has an important role in

respect to pancreatic islet function. Cooper et al. (1988) presented evidence that the 37- amino acid peptide may be a hormone present in normal individuals; hence, 'diabetes- associated peptide' is an inappropriate designation. Cooper et al. (1988) synthesized whole amylin by using solid- phase techniques, with formation of the disulfide linkage by oxidation in dilute aqueous solution and recovery of the peptide by lyophilization. The effects of amylin on glucose metabolism were studied by 2 in vitro preparations: isolated rat soleus muscle strips and isolated rat adipocytes. In skeletal muscle, amylin resulted in a marked decrease in insulin- stimulated glycogen synthesis with resulting reduction in insulin- stimulated glucose uptake. In muscle, amylin resulted in a failure of response to the concentration of insulin required to stimulate glucose uptake half- maximally in untreated muscles. No effects were observed in isolated adipocytes. Amylin may be a factor in the etiology of the insulin resistance in type II diabetes mellitus. A correlation has been observed between the extent of islet amyloid deposition and the clinical severity of type II diabetes. Mosselman et al. (1988) isolated and partially characterized the human IAPP gene. By hybridization to DNA from human- rodent somatic cell hybrids, Mosselman et al. (1988) demonstrated that the IAPP gene is located on 12pter- q14. Because of the striking parallelism in the genetic constitution of chromosomes 11 and 12, suggesting an ancient tetraploidization, the mapping of this calcitonin- related gene to 12 is of interest; 2 calcitonin genes are located on 11p. The amyloid in amyloid- producing medullary carcinoma of the thyroid, a feature of multiple endocrine neoplasia type II (OMIM Ref. No. 171400), is derived from calcitonin. Sanke et al. (1988) showed that the islet amyloid polypeptide is derived from an 89- amino acid precursor by proteolytic processing. The processed peptide, 37- amino acids long, is bracketed at its NH(2) and COOH termini by lys- arg and gly- lys- arg, respectively. The data indicated that this amyloid peptide is generated by proteolytic processing similar to that for proinsulin and other islet prohormones and also that the peptide may be carboxyamidated. Mosselman et al. (1989) found that 2 exons, which are approximately 5 kb apart, encode the 89- amino acid pre- pro- IAPP. A putative signal sequence at the amino- terminus of the precursor suggested that IAPP is a secreted protein. From the DNA sequence of a partial cDNA clone and a phage lambda genomic clone of the coding region of the amylin gene, Roberts et al. (1989) concluded that this peptide is synthesized as a precursor peptide called proamylin. The sequences of the genes for amylin and the calcitonin gene- related peptides show strong similarity, especially in their 5- prime coding regions, where these peptides have a conserved intramolecular disulfide bridge, and also in their 3- prime coding regions, where the presence of a glycine codon strongly suggests that the carboxyl- terminal residue, like that of CGRP, is amidated. In a study of the biologic activity of amylin synthesized with or without the disulfide bridge and/or amidation, Roberts et al. (1989) demonstrated that both features are necessary for full

biologic activity, thereby confirming the functional importance of those regions of the molecule that have been conserved at both protein and genetic levels. Animal model experiments lend further support to the function of IAPP. Janson et al. (1996) created homozygous transgenic mice with a high level of expression of human IAPP. Male transgenic mice spontaneously developed diabetes mellitus by 8 weeks of age, which was associated with selective beta- cell death and impaired insulin secretion. Approximately 20% of female transgenic mice spontaneously developed diabetes at 30 weeks of age when beta- cell degeneration and both amorphous and amyloid deposits of IAPP were present. Large deposits of IAPP- derived amyloid did not appear to be important to the cytotoxicity, but early, small amorphous intra- and extracellular aggregates of human IAPP were consistently present at the time of beta- cell death and therefore may be the most cytotoxic form of IAPP.

It is appreciated that the abovementioned animal model for IAPP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Cooper, G. J.; Willis, A. C.; Clark, A.; Turner, R. C.; Sim, R. B.; Reid, K. B. : Purification and characterization of a peptide from amyloid- rich pancreases of type 2 diabetic patients. Proc. Nat. Acad. Sci. 84: 8628- 8632, 1987. ; and

Cooper, G. J. S.; Leighton, B.; Dimitriadis, G. D.; Parry-Billings, M.; Kowalchuk, J. M.; Howland, K.; Rothbard, J. B.; Willis, A. C.; Reid, K. B. M. : Amylin found in amyloid deposits.

Further studies establishing the function and utilities of IAPP are found in John Hopkins OMIM database record ID 147940, and in cited publications listed in Table 9, hereby incorporated herein.

GAM347 ACE CTCCTAGGCTGGAGT GCAGTGG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is another GAM347 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM347 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM347 is therefore inhibition of ACE, a GAM347 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with

Alzheimer. Accordingly, utilities of GAM347 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM347 ADAM17 CTCCTAGGCTGGAGT A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis B A
GCAGTGG factor, (ADAM17, Accession NM_003183.3) is another GAM347 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM347 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM347 is therefore inhibition of ADAM17, a GAM347 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM347 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM347 APBB1 CTCCTAGGCTGGAGT Amyloid Beta (A4) Precursor Protein- binding, Family B, Member B A
GCAGTGG 1 (Fe65) (APBB1, Accession NM_145689.1) is another GAM347 target gene. APBB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APBB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM347 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM347 is therefore inhibition of APBB1, a GAM347 target gene which may modulate the internalization of beta- amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM347 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB1.The function of APBB1 has been established by previous studies. APP, a widely expressed cell surface protein, is cleaved in the transmembrane region by gamma-secretase. Gamma- cleavage of APP produces the extracellular amyloid beta peptide of Alzheimer disease and releases an intracellular tail fragment. Cao and Sudhof (2001) demonstrated that the cytoplasmic tail of APP forms a multimeric complex with the nuclear adaptor protein Fe65 and the histone acetyltransferase TIP60 (OMIM Ref. No.

601409). This complex potently stimulated transcription via heterologous Gal4 or LexA DNA binding domains, suggesting that release of the cytoplasmic tail of APP by gamma- cleavage may function in gene expression. Hu et al. (2002) demonstrated that a protective (minor) second allele alters the splicing of the terminal exon by selection of an alternative acceptor site within exon 14. The resulting isoform, FE65a2, lacks the 55 amino acids of the C-terminal APP binding site, which are replaced by 53 missense residues. Pull- down assays confirmed that the FE65a2 isoform bound to APP less efficiently, suggesting that an attenuated binding of FE65 with APP may be, in part, responsible for resistance to the very late onset disease. Sequence analysis of FE65 in mice, non-human primates, and man revealed that the susceptibility allele, which codes for stronger binding of the FE65 protein to APP, was favored by natural selection leading to our lineage. The authors hypothesized that this allele may contribute to a very late onset form of Alzheimer disease.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Cao, X.; Sudhof, T. C. : A transcriptively active complex of APP with Fe65 and histone acetyltransferase Tip60. Science 293: 115-120, 2001. ; and

Hu, Q.; Cool, B. H.; Wang, B.; Hearn, M. G.; Martin, G. M. : A candidate molecular mechanism for the association of an intronic polymorphism of FE65 with resistance to very late onset d.

Further studies establishing the function and utilities of APBB1 are found in John Hopkins OMIM database record ID 602709, and in cited publications listed in Table 9, hereby incorporated herein.

GAM347	APPBP2	CTCCTAGGCTGGAGT GCAGTGG	Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is another GAM347 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM347 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	B	A

Another function of GAM347 is therefore inhibition of APPBP2, a GAM347 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM347 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM347 FPRL1 CTCCTAGGCTGGAGT FPRL1 (Accession NM_001462.1) is another GAM347 target gene. B A

GCAGTGG FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM347 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM347 is therefore inhibition of FPRL1. Accordingly, utilities of GAM347 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM347 IAPP CTCCTAGGCTGGAGT Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM347 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM347 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

GCAGTGG

Another function of GAM347 is therefore inhibition of IAPP, a GAM347 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM347 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP has been established by previous studies. IAPP has cysteine residues in positions 2 and 7, a feature found in all known calcitonin gene- related peptides (OMIM Ref. No. 114130). IAPP shows 46% amino acid sequence homology with CGRP II (OMIM Ref. No. 114160). Since IAPP has been demonstrated immunochemically in normal beta cells of several mammals, it probably has an important role in respect to pancreatic islet function. Cooper et al. (1988) presented evidence that the 37- amino acid peptide may be a hormone present in normal individuals; hence, 'diabetes- associated peptide' is an inappropriate designation. Cooper et al. (1988) synthesized whole amylin by using solid- phase techniques, with formation of the disulfide linkage by oxidation in dilute aqueous solution and recovery of the peptide by lyophilization. The effects of amylin on glucose metabolism were studied by 2 in vitro preparations: isolated rat soleus muscle strips and isolated rat adipocytes. In skeletal muscle, amylin resulted in a marked decrease in insulin- stimulated glycogen synthesis with resulting reduction in insulin- stimulated glucose uptake. In muscle, amylin resulted in a failure of response to the concentration of insulin required to stimulate glucose uptake

half- maximally in untreated muscles. No effects were observed in isolated adipocytes. Amylin may be a factor in the etiology of the insulin resistance in type II diabetes mellitus. A correlation has been observed between the extent of islet amyloid deposition and the clinical severity of type II diabetes. Mosselman et al. (1988) isolated and partially characterized the human IAPP gene. By hybridization to DNA from human- rodent somatic cell hybrids, Mosselman et al. (1988) demonstrated that the IAPP gene is located on 12pter- q14. Because of the striking parallelism in the genetic constitution of chromosomes 11 and 12, suggesting an ancient tetraploidization, the mapping of this calcitonin- related gene to 12 is of interest; 2 calcitonin genes are located on 11p. The amyloid in amyloid- producing medullary carcinoma of the thyroid, a feature of multiple endocrine neoplasia type II (OMIM Ref. No. 171400), is derived from calcitonin. Sanke et al. (1988) showed that the islet amyloid polypeptide is derived from an 89- amino acid precursor by proteolytic processing. The processed peptide, 37- amino acids long, is bracketed at its NH(2) and COOH termini by lys- arg and gly- lys- arg, respectively. The data indicated that this amyloid peptide is generated by proteolytic processing similar to that for proinsulin and other islet prohormones and also that the peptide may be carboxyamidated. Mosselman et al. (1989) found that 2 exons, which are approximately 5 kb apart, encode the 89- amino acid pre- pro- IAPP. A putative signal sequence at the amino- terminus of the precursor suggested that IAPP is a secreted protein. From the DNA sequence of a partial cDNA clone and a phage lambda genomic clone of the coding region of the amylin gene, Roberts et al. (1989) concluded that this peptide is synthesized as a precursor peptide called proamylin. The sequences of the genes for amylin and the calcitonin gene- related peptides show strong similarity, especially in their 5- prime coding regions, where these peptides have a conserved intramolecular disulfide bridge, and also in their 3- prime coding regions, where the presence of a glycine codon strongly suggests that the carboxyl- terminal residue, like that of CGRP, is amidated. In a study of the biologic activity of amylin synthesized with or without the disulfide bridge and/or amidation, Roberts et al. (1989) demonstrated that both features are necessary for full biologic activity, thereby confirming the functional importance of those regions of the molecule that have been conserved at both protein and genetic levels. Animal model experiments lend further support to the function of IAPP. Janson et al. (1996) created homozygous transgenic mice with a high level of expression of human IAPP. Male transgenic mice spontaneously developed diabetes mellitus by 8 weeks of age, which was associated with selective beta- cell death and impaired insulin secretion. Approximately 20% of female transgenic mice spontaneously developed diabetes at 30 weeks of age when beta- cell degeneration and both amorphous and amyloid deposits of IAPP were present. Large deposits of IAPP- derived amyloid did not appear to be important to the cytotoxicity, but early, small amorphous intra- and extracellular aggregates of human IAPP were

consistently present at the time of beta- cell death and therefore may be the most cytotoxic form of IAPP.

It is appreciated that the abovementioned animal model for IAPP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Cooper, G. J.; Willis, A. C.; Clark, A.; Turner, R. C.; Sim, R. B.; Reid, K. B. : Purification and characterization of a peptide from amyloid- rich pancreases of type 2 diabetic patients. Proc. Nat. Acad. Sci. 84: 8628- 8632, 1987. ; and

Cooper, G. J. S.; Leighton, B.; Dimitriadis, G. D.; Parry-Billings, M.; Kowalchuk, J. M.; Howland, K.; Rothbard, J. B.; Willis, A. C.; Reid, K. B. M. : Amylin found in amyloid deposits.

Further studies establishing the function and utilities of IAPP are found in John Hopkins OMIM database record ID 147940, and in cited publications listed in Table 9, hereby incorporated herein.

GAM354 AVP ACACAGGCCCAGAGA AVP (Accession NM_000490.2) is a GAM354 target gene. AVP A A GGCAGTG BINDING SITE1 and AVP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by AVP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE1 and AVP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM354 is therefore inhibition of AVP. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM354 CRAT ACACAGGCCCAGAGA Carnitine Acetyltransferase (CRAT, Accession NM_144782.1) is A A GGCAGTG another GAM354 target gene. CRAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CRAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM354 is therefore inhibition of CRAT, a GAM354 target gene which catalyzes the reversible transfer

of acyl groups from an acyl- CoA thioester to carnitine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRAT.The function of CRAT has been established by previous studies. Carnitine acyltransferases are a group of enzymes that catalyze the reversible transfer of acyl groups from an acyl- CoA thioester to carnitine, thus forming the corresponding acylcarnitine. These enzymes can be distinguished according to their substrate specificity in carnitine palmitoyltransferase (see OMIM Ref. No. CPT1, 600528 and CPT2, 600650), carnitine octanoyltransferase (CROT; 606090), and carnitine acetyltransferase (EC 2.3.1.7). CRAT is a key enzyme for metabolic pathways involved with the control of the acyl- CoA/CoA ratio in mitochondria, peroxisomes, and endoplasmic reticulum Acetylcarnitine, which can be a precursor for acetylcholine synthesis catalyzed by choline acetyltransferase, is thought to slow the rate of mental deterioration in Alzheimer patients, and Kalaria and Harik (1992) found decreased function of CRAT in the brain of Alzheimer patients

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Kalaria, R. N.; Harik, S. I. : Carnitine acetyltransferase activity in the human brain and its microvessels is decreased in Alzheimer's disease. Ann. Neurol. 32: 583- 586, 1992. ; and

van der Leij, F. R.; Huijkman, N. C. A.; Boomsma, C.; Kuipers, J. R. G.; Bartelds, B. : Genomics of the human carnitine acyltransferase genes. Molec. Genet. Metab. 71: 139- 153, 2000.

Further studies establishing the function and utilities of CRAT are found in John Hopkins OMIM database record ID 600184, and in cited publications listed in Table 9, hereby incorporated herein.

GAM354 A A CTSB GGCAGTG ACACAGGCCCAGAGA CTSB (Accession NM_001908.2) is another GAM354 target gene. CTSB BINDING SITE1 and CTSB BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CTSB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE1 and CTSB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM354 is therefore inhibition of CTSB. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM354 MAPT ACACAGGCCCAGAGA Microtubule- associated Protein Tau (MAPT, Accession A A
GGCAGTG NM_173727.1) is another GAM354 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM354 is therefore inhibition of MAPT, a GAM354 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM354 NCSTN ACACAGGCCCAGAGA NCSTN (Accession NM_015331.1) is another GAM354 target gene. A A
GGCAGTG NCSTN BINDING SITE1 and NCSTN BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NCSTN, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCSTN BINDING SITE1 and NCSTN BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM354 is therefore inhibition of NCSTN, a GAM354 target gene which has a central role in presenilin-mediated processing of beta- amyloid precursor protein (beta- APP, MIM 104760) and some aspects of notch (MIM 190198)/glp- 1 signaling in vivo. and therefore is associated with Alzheimer. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCSTN.The function of NCSTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM354 S100B ACACAGGCCCAGAGA S100 Calcium- binding Protein, Beta (neural) (S100B, Accession A A
GGCAGTG NM_006272.1) is another GAM354 target gene. S100B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of S100B BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM354 is therefore inhibition of

S100B, a GAM354 target gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. and therefore is associated with Alzheimer. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with S100B.The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.

GAM354 A A SLC17A7 ACACAGGCCCAGAGA GGCAGTG SOLUTE CARRIER FAMILY 17, MEMBER 7 (SLC17A7, Accession NM_020309.1) is another GAM354 target gene. SLC17A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC17A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC17A7 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM354 is therefore inhibition of SLC17A7, a GAM354 target gene which is a brain- specific Na-dependent inorganic phosphate cotransporter and therefore is associated with Alzheimer. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC17A7.The function of SLC17A7 has been established by previous studies. Bellocchio et al. (2000) demonstrated that BNPI transports glutamate into synaptic vesicles. In addition, they showed that this vesicular glutamate transporter, which they renamed VGLUT1, exhibits a conductance for chloride that is blocked by glutamate. Bellocchio et al. (2000) found that glutamate was transported by BNPI in the absence of sodium. Vesicular glutamate transport has a substantially lower apparent affinity than the plasma membrane excitatory amino acid transporters. Glutamate transport by BNPI is saturated with a K(m) of approximately 2 mM, in the same range as transport by synaptic vesicles. Finally, plasma membrane glutamate transporters recognize both aspartate and glutamate as substrates, whereas vesicular glutamate transport does not recognize aspartate. Vesicular glutamate transport has a biphasic dependence on chloride concentration that may reflect the presence of anion binding site distinct from the site of substrate recognition. Chloride concentrations of approximately 4 to 10 mM appear optimal for transport, with substantially lower activity detected at higher and lower levels. BNPI transports glutamate with all of the functional characteristics previously reported for glutamate transport into native synaptic vesicles from the brain. It localizes to synaptic vesicles, and the mutant C. elegans eat- 4 (a BNPI ortholog) reduces glutamate release. BNPI thus functions as a vesicular glutamate transporter, VGLUT1. Only a subset of glutamate neurons expresses VGLUT1, but a closely related sequence has been identified that

appears to be expressed in brain regions that lack VGLUT1 (Aihara et al. 2000). The 2 isoforms together may therefore account for the uptake of glutamate by synaptic vesicles from all glutamatergic neurons. VGLUT1 (BNPI1) may thus function as both a phosphate transporter, presumably at the plasma membrane, and a glutamate transporter in synaptic vesicles. Bellocchio et al. (2000) stated that the localization of VGLUT1 to synaptic vesicles, the phenotype of the eat- 4 mutant, and biochemical evidence strongly suggest that vesicular glutamate transport is its primary role. Takamori et al. (2000) independently showed that expression of BNPI results in glutamate uptake by intracellular vesicles. Substrate specificity and energy dependence are very similar to glutamate uptake by synaptic vesicles. Stimulation of exocytosis resulted in quantal release of glutamate from BNPI- expressing cells. Furthermore, Takamori et al. (2000) expressed BNPI in neurons containing GABA (see OMIM Ref. No. 137150) and maintained them as cultures of single neurons that form synapses to themselves. After stimulation of these neurons, a component of the postsynaptic current is mediated by glutamate as it is blocked by a combination of the glutamate receptor antagonists, but is insensitive to a GABA- A receptor (see OMIM Ref. No. 137192) antagonist. Takamori et al. (2000) concluded that BNPI functions as a vesicular glutamate transporter and that expression of BNPI suffices to define a glutamatergic phenotype in neurons.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Bellocchio, E. E.; Reimer, R. J.; Fremeau, R. T. Jr.; Edwards, R. H. : Uptake of glutamate into synaptic vesicles by an inorganic phosphate transporter. Science 289: 957- 960, 2000. ; and

Takamori, S.; Rhee, J. S.; Rosenmund, C.; Jahn, R. : Identification of a vesicular glutamate transporter that defines a glutamatergic phenotype in neurons. Nature 407: 189- 194, 2000.

Further studies establishing the function and utilities of SLC17A7 are found in John Hopkins OMIM database record ID 605208, and in cited publications listed in Table 9, hereby incorporated herein.

GAM354 A A — SNCB ACACAGGCCCAGAGA GGCAGTG — Synuclein, Beta (SNCB, Accession NM_003085.2) is another target gene. SNCB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM354 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM354 is therefore inhibition of SNCB, a GAM354 target gene which may inhibit phospholipase D2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM354 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCB.The function of SNCB has been established by previous studies. Jakes et al. (1994) examined the composition of proteins found in Alzheimer disease neurofibrillary lesions. They identified 2 abundant proteins, both with apparent molecular weights of 19 kD. One was alpha- synuclein (OMIM Ref. No. 163890). Cloning and sequencing revealed that the other was a novel 134- amino acid protein, which they named beta- synuclein. The sequences of the 2 proteins are 61% identical, establishing the existence of a family of human brain synucleins. Northern blotting detected a strong 1.3- kb signal in adult human brain. Weak hybridization was observed in skeletal muscle. Immunohistochemical localization showed that beta- synuclein is concentrated in presynaptic nerve terminals. Spillantini et al. (1997) found no staining of beta- synuclein in Lewy bodies associated with Parkinson disease. Consistent with this, Lavedan et al. (1998) found no evidence of linkage to SNCB in the probands of 71 families with apparent autosomal dominant Parkinson disease drawn from the various ethnic backgrounds. Lavedan et al. (1998) found that the SNCB gene contains 5 coding exons and at least one 5- prime untranslated exon, with intron- exon junctions similar to those of alpha- synuclein. Spillantini et al. (1995) used PCR panels and fluorescence in situ hybridization to map the SNCB gene to human chromosome 5q35.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Lavedan, C.; Buchholtz, S.; Auburger, G.; Albin, R. L.; Athanassiadou, A.; Blancato, J.; Burguera, J. A.; Ferrell, R. E.; Kostic, V.; Leroy, E.; Leube, B.; Mota- Vieira, L.; and 9 others : Absence of mutation in the beta- and gamma- synuclein genes in familial autosomal dominant Parkinson's disease. DNA Research 5: 401- 402, 1998. ; and

Lavedan, C.; Leroy, E.; Torres, R.; Dehejia, A.; Dutra, A.; Buchholtz, S.; Nussbaum, R. L.; Polymeropoulos, M. H. : Genomic organization and expression of the human beta- synuclein gene.

Further studies establishing the function and utilities of SNCB are found in John Hopkins OMIM database record ID 602569, and in cited publications listed in Table 9, hereby incorporated herein.

GAM361 FHL2 CATTGCACTCCAGCC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

TAGGCAA a GAM361 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are

target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM361 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM361 is therefore inhibition of FHL2, a GAM361 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM361 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM361 HD CATTGCACTCCAGCC HD (Accession NM_002111.3) is another GAM361 target gene. HD A A
TAGGCAA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM361 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM361 is therefore inhibition of HD. Accordingly, utilities of GAM361 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM361 IGF1 CATTGCACTCCAGCC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
TAGGCAA NM_000618.2) is another GAM361 target gene. IGF1 BINDING SITE1 and IGF1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IGF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE1 and IGF1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM361 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM361 is therefore inhibition of IGF1, a GAM361 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM361 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM361 PRND CATTGCACTCCAGCC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

TAGGCAA another GAM361 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM361 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM361 is therefore inhibition of PRND, a GAM361 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM361 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM367 GYPA TGAGGTAAGTATGTT Glycophorin A (includes MN blood group) (GYPA, Accession A A

ATTGGAA NM_002099.2) is a GAM367 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM367 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM367 is therefore inhibition of GYPA, a GAM367 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM367 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM388 APP TGTGCACAACATGCA APP (Accession NM_000484.1) is a GAM388 target gene. APP A A

GGTTTGT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM388 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM388 is therefore inhibition of APP. Accordingly, utilities of GAM388 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APP.

GAM401 ACE TCACTGCAACCTCTG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A

CCTTCCG (ACE, Accession NM_152831.1) is a GAM401 target gene. ACE BINDING

SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM401 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM401 is therefore inhibition of ACE, a GAM401 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM401 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM401 IAPP TCACTGCAACCTCTG Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is A A CCTTCCG another GAM401 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM401 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM401 is therefore inhibition of IAPP, a GAM401 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM401 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM401 MTNR1A TCACTGCAACCTCTG Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is A A CCTTCCG another GAM401 target gene. MTNR1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTNR1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM401 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM401 is therefore inhibition of MTNR1A, a GAM401 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM401 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and

clinical conditions associated with MTNR1A.The function of MTNR1A has been established by previous studies. Reppert and Weaver (1995) reviewed the hormonal properties of melatonin and the characteristics of the melatonin receptors. Brzezinski (1997) likewise gave a comprehensive review of the function of melatonin and its clinical implications. Sleep disruption, nightly restlessness, sundowning, and other circadian disturbances are frequently seen in Alzheimer disease (AD; 104300) patients. Since melatonin is the main endocrine message for circadian rhythmicity from the pineal, Liu et al. (1999) studied melatonin levels in the cerebrospinal fluid (CSF) of 85 AD patients and 82 age- matched controls. In old control subjects (older than 80 years of age), CSF melatonin levels were half those of control subjects 41 to 80 years of age. In AD patients the CSF melatonin levels were only one- fifth of those in control subjects. The authors did not find a diurnal rhythm in CSF melatonin levels in control subjects or AD patients Von Gall et al. (2002) demonstrated that cycling expression of the clock gene Period- 1 (OMIM Ref. No. 602260) in rodent pituitary cells depends on the heterologous sensitization of the adenosine A2B receptor (OMIM Ref. No. 600446), which occurs through the nocturnal activation of melatonin mt1 receptors. Eliminating the impact of the neurohormone melatonin simultaneously suppresses the expression of Period- 1 and evokes an increase in the release of pituitary prolactin. Von Gall et al. (2002) concluded that their observations expose a mechanism by which 2 convergent signals interact within a temporal dimension to establish high- amplitude, precise, and robust cycles of gene expression.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

von Gall, C.; Garabette, M. L.; Kell, C. A.; Frenzel, S.; Dehghani, F.; Schumm- Draeger, P.- M.; Weaver, D. R.; Korf, H.- W.; Hastings, M. H.; Stehle, J. H. : Rhythmic gene expression in pituitary depends on heterologous sensitization by the neurohormone melatonin. Nature Neurosci. 5: 234- 238, 2002. ; and

Weaver, D. R.; Rivkees, S. A.; Carlson, L. L.; Reppert, S. M. : Localization of melatonin receptors in mammalian brain.In: Klein, D. C.; Moore, R. Y.; Reppert, S. M. : Suprachiasmatic.

Further studies establishing the function and utilities of MTNR1A are found in John Hopkins OMIM database record ID 600665, and in cited publications listed in Table 9, hereby incorporated herein.

GAM401 A A NCKAP1 TCACTGCAACCTCTG CCTTCCG NCKAP1 (Accession NM_013436.2) is another GAM401 target gene. NCKAP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM401 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM401 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM401 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM401 NGB TCACTGCAACCTCTG Neuroglobin (NGB, Accession NM_021257.2) is another GAM401 A A

CCTTCCG target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM401 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM401 is therefore inhibition of NGB, a GAM401 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM401 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM408 IGF1 CTGGGATGGAGGAGA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

ATTAGAG NM_000618.2) is a GAM408 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM408 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM408 is therefore inhibition of IGF1, a GAM408 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM408 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM426 CRAT TCTGGATTTGAGAGG Carnitine Acetyltransferase (CRAT, Accession NM_004003.2) is a A A

CTTTACT GAM426 target gene. CRAT BINDING SITE is a target binding site found

in the 5` untranslated region of multiple transcripts of mRNA encoded by CRAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM426 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM426 is therefore inhibition of CRAT, a GAM426 target gene which catalyzes the reversible transfer of acyl groups from an acyl- CoA thioester to carnitine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM426 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRAT.The function of CRAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM426 DHCR24 TCTGGATTTGAGAGG 24- dehydrocholesterol Reductase (DHCR24, Accession A A

CTTTACT NM_014762.1) is another GAM426 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM426 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM426 is therefore inhibition of DHCR24, a GAM426 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM426 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM492 CAV2 CCGTAAAATGTTCAA Caveolin 2 (CAV2, Accession NM_001233.2) is a GAM492 target A A

ATGTTTT gene. CAV2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAV2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM492 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM492 is therefore inhibition of CAV2, a GAM492 target gene which may function as an accessory protein in conjunction with caveolin- 1and act as a scaffolding protein within caveolar membranes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM492 include diagnosis, prevention and

treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV2.The function of CAV2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM492 PRND AAAGCTTTGTTCATT GTATCTG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM492 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM492 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM492 is therefore inhibition of PRND, a GAM492 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM492 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM495 BACE AAAATGCTTACAGGC AGTAGCC Beta- site APP- cleaving Enzyme (BACE, Accession NM_138973.1) is a GAM495 target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM495 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM495 is therefore inhibition of BACE, a GAM495 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM495 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM495 CAV2 AAAATGCTTACAGGC AGTAGCC Caveolin 2 (CAV2, Accession NM_001233.2) is another GAM495 target gene. CAV2 BINDING SITE1 through CAV2 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by CAV2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV2 BINDING SITE1 through CAV2 BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of A A

GAM495 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM495 is therefore inhibition of CAV2, a GAM495 target gene which may function as an accessory protein in conjunction with caveolin- 1and act as a scaffolding protein within caveolar membranes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM495 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV2.The function of CAV2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM507 BACE2 GAGAGAGGTAGAGGG GAGCAGA Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is a GAM507 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM507 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM507 is therefore inhibition of BACE2, a GAM507 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM507 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM507 DLST GAGAGAGGTAGAGGG GAGCAGA Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM507 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM507 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM507 is therefore inhibition of DLST, a GAM507 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM507 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM507 A A GFAP GAGAGAGGTAGAGGG GAGCAGA GFAP (Accession NM_002055.2) is another GAM507 target gene. GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM507 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM507 is therefore inhibition of GFAP. Accordingly, utilities of GAM507 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM519 CRYAB A A TGTGGCTTAGGTGAG CATGTGA CRYAB (Accession NM_001885.1) is a GAM519 target gene. CRYAB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CRYAB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRYAB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM519 is therefore inhibition of CRYAB. Accordingly, utilities of GAM519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRYAB.

GAM519 B A CNTF TCCCACAGCTTCCTA GCCACAG Ciliary Neurotrophic Factor (CNTF, Accession NM_000614.2) is another GAM519 target gene. CNTF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNTF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CNTF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM519 is therefore inhibition of CNTF, a GAM519 target gene which is a survival factor for various neuronal cell types. and therefore is associated with Alzheimer. Accordingly, utilities of GAM519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CNTF.The function of CNTF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM175.

GAM519 B A GLUL TCCCACAGCTTCCTA Glutamate- ammonia Ligase (glutamine synthase) (GLUL, Accession

GCCACAG NM_002065.3) is another GAM519 target gene. GLUL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLUL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GLUL BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM519 is therefore inhibition of GLUL, a GAM519 target gene which catalyzes the condensation of glutamate and ammonia to form glutamine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GLUL.The function of GLUL has been established by previous studies. Glutamine synthetase (EC 6.3.1.2), also called glutamate- ammonia ligase (GLUL), is expressed throughout the body and plays an important role in controlling body pH and in removing ammonia from the circulation. The enzyme clears L- glutamate, the major neurotransmitter in the central nervous system, from neuronal synapses (see OMIM Ref. No. references in Clancy et al. 1996). Gibbs et al. (1987) reported the complete 1,119- bp coding sequence of glutamine synthetase, which they determined from a liver- derived cDNA. Pesole et al. (1991) suggested that glutamine synthetase is a good molecular clock for determining times of divergence even as great as that which occurred between eukaryotes and prokaryotes. One conclusion reached by Pesole et al. (1991) was that organelle- specific enzymes, such as those of the mitochondria, may have originated from a duplication of nuclear genes. The endosymbiotic hypothesis suggests that a transfer of prokaryotic genes to nuclei occurred during the evolution of the primitive eukaryotic cell. In some cases, it is likely that the old prokaryotic gene could not be active in the new nuclear genome environment and was totally lost because its function in the organelle could be dispensed with. Subsequently, a new organelle-specific enzyme could have originated to serve specialized metabolic functions. The presence of glutamine synthetase in mitochondria is linked to the nitrogen metabolism of the species, and in particular to the need for glutamine as a source of ammonia and for particular biochemical pathways for ammonia detoxification.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Gibbs, C. S.; Campbell, K. E.; Wilson, R. H. : Sequence of a human glutamine synthetase cDNA. Nucleic Acids Res. 15: 6293 only, 1987. ; and

Pesole, G.; Bozzetti, M. P.; Lanave, C.; Preparata, G.; Saccone, C. : Glutamine synthetase gene evolution: a good molecular

clock. Proc. Nat. Acad. Sci. 88: 522- 526, 1991.

Further studies establishing the function and utilities of GLUL are found in John Hopkins OMIM database record ID 138290, and in cited publications listed in Table 9, hereby incorporated herein.

GAM520 BACE TCTGGTTTGAGAGAC Beta- site APP- cleaving Enzyme (BACE, Accession NM_138972.1) A A

AATGACA is a GAM520 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM520 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM520 is therefore inhibition of BACE, a GAM520 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM520 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM520 DHCR24 TCTGGTTTGAGAGAC 24- dehydrocholesterol Reductase (DHCR24, Accession A A

AATGACA NM_014762.1) is another GAM520 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM520 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM520 is therefore inhibition of DHCR24, a GAM520 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM520 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM520 THOP1 TCTGGTTTGAGAGAC Thimet Oligopeptidase 1 (THOP1, Accession NM_003249.2) is A A

AATGACA another GAM520 target gene. THOP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by THOP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of THOP1 BINDING SITE, and secondary structure complementarity to

the nucleotide sequence of GAM520 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM520 is therefore inhibition of THOP1, a GAM520 target gene which involves in the metabolism of neuropeptide and in cytoplasmic peptide degradation. and therefore is associated with Alzheimer. Accordingly, utilities of GAM520 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with THOP1.The function of THOP1 has been established by previous studies. Papastoitsis et al. (1994) purified and characterized the metalloprotease from human Alzheimer disease brain that is able to cleave a synthetic peptide encompassing the amino- terminus of amyloid beta peptide and generate amyloidogenic fragments from recombinant human APP. Sequence comparison revealed that this enzyme has high homology to the previously described rat metalloendopeptidase 24.15 (EC 3.4.24.15). The beta- secretase- like activity of the human enzyme in vitro in combination with its localization in neurons and its co- localization with APP in transport vesicles purified from rabbit optic nerve rendered this enzyme an interesting candidate for amyloidogenic processing of APP. Using a cDNA encoding the rat enzyme, Meckelein et al. (1996) assigned the human gene, symbolized THOP1, to chromosome 19 by hybridization to DNA from human/rodent somatic cell hybrids. By fluorescence in situ hybridization, they localized the gene to 19q13.3. However, after localizing the THOP1 gene to the high-resolution cosmid contig map of human chromosome 19, Torres et al. (1998) found that the FISH mapping to 19q13.3 by Meckelein et al. (1996) was incorrect. Results of the hybridization and FISH mapping of positive clones indicated localization of THOP1 to 19p13.3, thus excluding THOP1 as a candidate gene for AD2.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Papastoitsis, G.; Siman, R.; Scott, R.; Abraham, C. R. : Identification of a metalloprotease from Alzheimer's disease brain able to degrade the beta- amyloid precursor protein and generate amyloidogenic fragments. Biochemistry 33: 192- 199, 1994. ; and

Meckelein, B.; Rohan de Silva, H. A.; Roses, A. D.; Rao, P. N.; Pettenati, M. J.; Xu, P.- T.; Hodge, R.; Glucksman, M. J.; Abraham, C. R. : Human endopeptidase (THOP1) is localized on chr.

Further studies establishing the function and utilities of THOP1 are found in John Hopkins OMIM database record ID 601117, and in cited publications listed in Table 9, hereby incorporated herein.

GAM550	ADAM17	TTTGCACACTTTCCA	A	Disintegrin and Metalloproteinase Domain 17 (tumor necrosis	A

A

AGTTGCC factor, (ADAM17, Accession NM_003183.3) is a GAM550 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM550 is therefore inhibition of ADAM17, a GAM550 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM550 B2M TTTGCACACTTTCCA Beta- 2- microglobulin (B2M, Accession NM_004048.1) is another A A

AGTTGCC GAM550 target gene. B2M BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by B2M, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of B2M BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM550 is therefore inhibition of B2M, a GAM550 target gene which is the beta- chain of major histocompatibility complex class I molecules. and therefore is associated with Alzheimer. Accordingly, utilities of GAM550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with B2M.The function of B2M and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM205.

GAM550 CTNND2 TTTGCACACTTTCCA Catenin (cadherin- associated protein), Delta 2 (neural A A
AGTTGCC plakophilin- rel (CTNND2, Accession NM_001332.1) is another GAM550 target gene. CTNND2 BINDING SITE1 and CTNND2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CTNND2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTNND2 BINDING SITE1 and CTNND2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM550 is therefore inhibition of CTNND2, a GAM550 target gene which interacts with presenilin 1

(PSEN1) and is a member of the plakoglobin/armadillo family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTNND2.The function of CTNND2 has been established by previous studies. Armadillo- like proteins are characterized by a series of armadillo repeats, first defined in the Drosophila 'armadillo' gene product, that are typically 42 to 45 amino acids long. These proteins can be divided into subfamilies based on the number of repeats, their overall sequence similarity, and the dispersion of the repeats throughout their sequences. Members of the p120(ctn)/plakophilin subfamily of Armadillo- like proteins, including CTNND1 (OMIM Ref. No. 601045), CTNND2, PKP1 (OMIM Ref. No. 601975), PKP2 (OMIM Ref. No. 602861), PKP4 (OMIM Ref. No. 604276), and ARVCF (OMIM Ref. No. 602269), have 10 armadillo repeats each In a search for proteins with sequence homology to PKP1, Paffenholz and Franke (1997) identified a human cDNA with 45% amino acid identity to PKP1 in a segment within the armadillo (arm) repeat units. Antibodies raised against the arm repeat region recognized 2 polypeptide bands of approximately 150 and 160 kD in immunoblots of mouse brain and a weak band of approximately 160 kD in mouse skeletal muscle and pancreas. The authors, therefore, named the protein NPRAP for 'neural plakophilin- related arm- repeat protein.' Paffenholz and Franke (1997) isolated 2 partial human cDNA clones from a human fetal brain cDNA library. The longer displays 91% identity to the complete mouse cDNA. Northern blot analysis of a number of human and bovine cell lines and tissues detected CTNND2 expression as 5- and 6- kb transcripts only in human fetal brain RNA

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Paffenholz, R.; Franke, W. W. : Identification and localization of a neurally expressed member of the plakoglobin/armadillo multigene family. Differentiation 61: 293- 304, 1997. ; and

Medina, M.; Marinescu, R. C.; Overhauser, J.; Kosik, K. S. : Hemizygosity of delta- catenin (CTNND2) is associated with severe mental retardation in cri- du- chat syndrome. Genomics 63: 157.

Further studies establishing the function and utilities of CTNND2 are found in John Hopkins OMIM database record ID 604275, and in cited publications listed in Table 9, hereby incorporated herein.

GAM550 IGF1 TTTGCACACTTTCCA AGTTGCC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM550 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure

complementarity to the nucleotide sequence of GAM550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM550 is therefore inhibition of IGF1, a GAM550 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM550 PRNP TTTGCACACTTTCCA AGTTGCC Prion Protein (p27- 30) (Creutzfeld- Jakob disease, Gerstmann- Strausler- (PRNP, Accession NM_000311.1) is another GAM550 target gene. PRNP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRNP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRNP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM550 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM550 is therefore inhibition of PRNP, a GAM550 target gene which the function of prp is not known. prp is encoded in the host genome and is expressed both in normal and infected cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRNP.The function of PRNP has been established by previous studies. Mutations in the prion protein gene are associated with Gerstmann- Straussler disease (GSD; 137440), Creutzfeldt- Jakob disease (CJD; 123400), and familial fatal insomnia (OMIM Ref. No. 600072), and aberrant isoforms of the prion protein can act as an infectious agent in these disorders as well as in kuru (OMIM Ref. No. 245300) and in scrapie in sheep. Riek et al. (1998) used the refined NMR structure of the mouse prion protein to investigate the structural basis of inherited human transmissible spongiform encephalopathies. In the cellular form of mouse prion protein, no spatial clustering of mutation sites was observed that would indicate the existence of disease- specific subdomains. A hydrogen bond between residues 128 and 178 provided a structural basis for the observed highly specific influence of a polymorphism at position 129 in human PRNP on the disease phenotype that segregates with the asp178- to- asn (D178N; 176640.0007) mutation. Overall, the NMR structure implied that only some of the disease-related amino acid replacements lead to reduced stability of the cellular form of PRNP, indicating that subtle structural differences in the mutant proteins may affect intermolecular signaling in a variety of different ways. Windl et al. (1999) searched for mutations and polymorphisms in the coding region of the PRNP gene in

578 patients with suspect prion diseases referred to the German Creutzfeldt- Jakob disease surveillance unit over a period of 4.5 years. They found 40 cases with a missense mutation previously reported as pathogenic. Among these, the D178N mutation was the most common. In all of these cases, D178N was coupled with methionine at codon 129, resulting in the typical fatal familial insomnia genotype. Two novel missense mutations and several silent polymorphisms were found. In their Figure 1, Windl et al. (1999) diagrammed the known pathogenic mutations in the coding region of PRNP. Mead et al. (2001) analyzed the PRNP locus for tightly linked susceptibility factors for prion disease. They identified 56 polymorphic sites within 25 kb of the PRNP open reading frame, including sites within the PRNP promoter and the PRNP 3- prime untranslated region. These were characterized in 61 CEPH families, demonstrating extensive linkage disequilibrium around PRNP and the existence of 11 major European PRNP haplotypes. A common haplotype was overrepresented in patients with sporadic Creutzfeldt- Jakob disease. They could demonstrate that, in addition to the strong susceptibility conferred by codon 129, there was a significant independent association between sporadic CJD and a polymorphism upstream of PRNP. Although their sample size was necessarily small, no association was found between these polymorphisms and variant CJD or iatrogenic CJD, in keeping with their having distinct disease mechanisms. Cousens et al. (2001) described a cluster of variant CJD near the Leicestershire village of Queniborough in the U.K. Mead et al. (2001) could find no evidence of a PRNP founder susceptibility effect in that cluster. Animal model experiments lend further support to the function of PRNP. The incubation period and the neuropathology of transmissible spongiform encephalopathies have been extensively used to distinguish prion isolates (or strains) inoculated into panels of inbred mouse strains. Such studies have shown that the bovine spongiform encephalopathy (BSE) agent is indistinguishable from the agent causing variant Creutzfeldt- Jakob disease (vCJD), but differs from isolates of sporadic CJD, reinforcing the idea that the vCJD epidemic in Britain results from consumption of contaminated beef products. Manolakou et al. (2001) presented a mouse model for genetic and environmental factors that modify the incubation period of BSE cross- species transmission. They used 2 mouse strains that carried the same PrP allele, but displayed a 100- day difference in their mean incubation period following intracerebral inoculation with primary BSE isolate. They reported genetic effects on incubation period that map to 4 chromosomal regions in the mouse, and in addition they found significant factors of host environment, namely, the age of the host's mother, the age of the host at infection, and an interaction between the X chromosome and the cytoplasm in the host. Miele et al. (2002) identified 3 genes involved in mitochondrial physiology that were differentially expressed in the postnatal developing brains of normal mice and Prnp - /- mice. Further analysis showed that compared to the hippocampal CA1 regions of Prnp / mice, those of

Prnp - /- mice contained 40% fewer mitochondria, unusual mitochondrial morphology, and significantly increased activity of mitochondrial manganese- dependent antioxidant superoxide dismutase (SOD2; 147460), suggesting greater levels of oxidative assault. These results suggested that there is a relationship between normal cellular PrP expression and quality and quantity of mitochondria.

It is appreciated that the abovementioned animal model for PRNP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Miele, G.; Jeffrey, M.; Turnbull, D.; Manson, J.; Clinton, M. : Ablation of cellular prion protein expression affects mitochondrial numbers and morphology. Biochem. Biophys. Res. Commun. 291: 372-377, 2002. ; and

Cousens, J.; Smith, P. G.; Ward, H.; Everington, D.; Knight, R. S. G.; Zeidler, M.; Stewart, G.; Smith- Bathgate, E. A. B.; Macleod, M.- A.; Mackenzie, J.; Will, R. G. : Geographical dis.

Further studies establishing the function and utilities of PRNP are found in John Hopkins OMIM database record ID 176640, and in cited publications listed in Table 9, hereby incorporated herein.

GAM569 AVP ACACAGGCCCAGAGA AVP (Accession NM_000490.2) is a GAM569 target gene. AVP A A

GGCAGTG BINDING SITE1 and AVP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by AVP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE1 and AVP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM569 is therefore inhibition of AVP. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM569 CRAT ACACAGGCCCAGAGA Carnitine Acetyltransferase (CRAT, Accession NM_144782.1) is A A

GGCAGTG another GAM569 target gene. CRAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CRAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set

forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM569 is therefore inhibition of CRAT, a GAM569 target gene which catalyzes the reversible transfer of acyl groups from an acyl- CoA thioester to carnitine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRAT.The function of CRAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM569 CTSB ACACAGGCCCAGAGA A A GGCAGTG CTSB (Accession NM_001908.2) is another GAM569 target gene. CTSB BINDING SITE1 and CTSB BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CTSB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE1 and CTSB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM569 is therefore inhibition of CTSB. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM569 MAPT ACACAGGCCCAGAGA A A GGCAGTG Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM569 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM569 is therefore inhibition of MAPT, a GAM569 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM569 NCSTN ACACAGGCCCAGAGA A A GGCAGTG NCSTN (Accession NM_015331.1) is another GAM569 target gene. NCSTN BINDING SITE1 and NCSTN BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NCSTN, corresponding to target binding sites such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCSTN BINDING SITE1 and NCSTN BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM569 is therefore inhibition of NCSTN, a GAM569 target gene which has a central role in presenilin-mediated processing of beta- amyloid precursor protein (beta- APP, MIM 104760) and some aspects of notch (MIM 190198)/glp- 1 signaling in vivo. and therefore is associated with Alzheimer. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCSTN.The function of NCSTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM569 S100B ACACAGGCCCAGAGA S100 Calcium- binding Protein, Beta (neural) (S100B, Accession A A GGCAGTG NM_006272.1) is another GAM569 target gene. S100B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of S100B BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM569 is therefore inhibition of S100B, a GAM569 target gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. and therefore is associated with Alzheimer. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with S100B.The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.

GAM569 SLC17A7 ACACAGGCCCAGAGA SOLUTE CARRIER FAMILY 17, MEMBER 7 (SLC17A7, Accession A A GGCAGTG NM_020309.1) is another GAM569 target gene. SLC17A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC17A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC17A7 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM569 is therefore inhibition of SLC17A7, a GAM569 target gene which is a brain- specific Na-dependent inorganic phosphate cotransporter and therefore is associated with Alzheimer. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other

diseases and clinical conditions associated with SLC17A7.The function of SLC17A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM569 SNCB ACACAGGCCCAGAGA Synuclein, Beta (SNCB, Accession NM_003085.2) is another GAM569 A A GGCAGTG target gene. SNCB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM569 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM569 is therefore inhibition of SNCB, a GAM569 target gene which may inhibit phospholipase D2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM569 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCB.The function of SNCB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM572 IGF1 TAAGTGAGTAGGCAT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A TGTTCT NM_000618.2) is a GAM572 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM572 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM572 is therefore inhibition of IGF1, a GAM572 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM572 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM584 TRPM2 GGCCCCTTTGTGAGG TRPM2 (Accession NM_003307.1) is a GAM584 target gene. TRPM2 A A CACGCTT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM584 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM584 is therefore inhibition of TRPM2, a

GAM584 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM584 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM588 A A BACE TCCAGTGAAACAGGT CTCTTTG Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) is a GAM588 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM588 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM588 is therefore inhibition of BACE, a GAM588 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM588 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM588 A A TNFRSF5 TCCAGTGAAACAGGT CTCTTTG TNFRSF5 (Accession NM_152854.1) is another GAM588 target gene. TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM588 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM588 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM588 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM593 A A HTR2A ACAGCAAGTCTTTGT CAAAGCT 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession NM_000621.1) is a GAM593 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM593 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM593 is therefore inhibition of HTR2A, a GAM593 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM593 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A has been established by previous studies. Serotonin (5-hydroxytryptamine; 5- HT) is a neurotransmitter that occupies a uniquely important place in neurobiology because of its role in many physiologic processes such as sleep, appetite, thermoregulation, pain perception, hormone secretion, and sexual behavior. Abnormality of the serotonergic system has been implicated in a number of human diseases such as mental depression, migraine, epilepsy, obsessive-compulsive behavior, and affective disorder. Like other neurotransmitters, 5- HT is released into the synaptic junction and exerts its effect on specific receptors on the postsynaptic membranes. Based on differential radioligand binding affinities, at least 6 types of 5- HT receptors have been identified: 5- HT- 1A, - 1B, - 1C, - 1D, - 2, and - 3 (Peroutka, 1988). The deduced amino acid sequences of the human, mouse, and rat 5- HT2 receptors are highly conserved; all 3 share a 90% sequence identity (Chen et al. 1992). Kato et al. (1996) presented evidence for genomic imprinting of the HTR2 gene. They demonstrated that the HTR2 gene was expressed only from the maternal allele.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Holmes, C.; Arranz, M. J.; Powell, J. F.; Collier, D. A.; Lovestone, S. : 5- HT- 2A and 5- HT- 2C receptor polymorphisms and psychopathology in late onset Alzheimer's disease. Hum. Molec. Genet. 7: 1507- 1509, 1998. ; and

Hsieh, C.- L.; Bowcock, A. M.; Farrer, L. A.; Hebert, J. M.; Huang, K. N.; Cavalli- Sforza, L. L.; Julius, D.; Francke, U. : The serotonin receptor subtype 2 locus HTR2 is on human chromo.

Further studies establishing the function and utilities of HTR2A are found in John Hopkins OMIM database record ID 182135, and in cited publications listed in Table 9, hereby incorporated herein.

GAM593 VLDLR ACAGCAAGTCTTTGT CAAAGCT Very Low Density Lipoprotein Receptor (VLDLR, Accession NM_003383.1) is another GAM593 target gene. VLDLR BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by VLDLR, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of VLDLR BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM593 RNA are set A A

forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM593 is therefore inhibition of VLDLR, a GAM593 target gene which may play a crucial role in triglyceride metabolism and therefore is associated with Alzheimer. Accordingly, utilities of GAM593 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with VLDLR.The function of VLDLR has been established by previous studies. A specific isoform of apolipoprotein E (OMIM Ref. No. 107741), encoded by the APOE4 allele, is associated with the accelerated rate of disease expression of sporadic Alzheimer disease (AD) and late- onset familial AD. Okuizumi et al. (1995) noted that, in patients who carry the APOE4 allele, an earlier age of onset has also been demonstrated in patients who also have mutations in the amyloid precursor protein gene (OMIM Ref. No. 104760) involving codon 717 (104760.0002) and codons 670 and 671 (104760.0008). On the other hand, the presence of the APOE4 allele makes no difference in familial AD patients with APP692 (104760.0005) or APP693 mutations, nor does it make a difference in chromosome 14- linked familial AD patients (OMIM Ref. No. 104311). Hypothesizing that receptors for APOE- containing lipoproteins act as a potential risk factor for AD, Okuizumi et al. (1995) performed an association study using a polymorphic triplet (CGG) repeat in the VLDLR gene. The frequency of the 5- repeat allele was significantly higher in all Japanese sporadic AD patients (P less than 0.02) than in Japanese controls. Moreover, the odds ratio was significantly increased in the AD patients homozygous for the 5- repeat allele; OR = 2.1, 95% confidence interval = 1.1- 4.2. Multiple logistic regression analysis showed that the relative risk conferred by the presence of 2 copies of the 5- repeat allele and at least 1 copy of the APOE4 allele is 8.7; 95% CI = 2.9- 25.8. Okuizumi et al. (1995) concluded that VLDLR is a susceptibility gene for AD. Animal model experiments lend further support to the function of VLDLR. Layering of neurons in the cerebral cortex and cerebellum requires reelin (RELN; 600514), an extracellular matrix protein, and mammalian disabled (DAB1; 603448), a cytosolic protein that activates tyrosine kinases. By targeted disruption experiments in mice, Trommsdorff et al. (1999) showed that 2 cell surface receptors, VLDLR and apolipoprotein E receptor- 2 (APOER2; 602600), are also required. Both receptors bound Dab1 on their cytoplasmic tails and were expressed in cortical and cerebellar layers adjacent to layers expressing Reln. Dab1 expression was upregulated in knockout mice lacking both the Vldlr and Apoer2 genes. Inversion of cortical layers, absence of cerebellar foliation, and the migration of Purkinje cells in these animals precisely mimicked the phenotype of mice lacking Reln or Dab1. These findings established novel signaling functions for the LDL receptor gene family and suggested that VLDLR and APOER2 participate in transmitting the extracellular RELN signal to intracellular signaling processes initiated by

DAB1.

It is appreciated that the abovementioned animal model for VLDLR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Okuizumi, K.; Onodera, O.; Namba, Y.; Ikeda, K.; Yamamoto, T.; Seki, K.; Ueki, A.; Nanko, S.; Tanaka, H.; Takahashi, H.; Oyanagi, K.; Mizusawa, H.; Kanazawa, I.; Tsuji, S. : Genetic association of the very low density lipoprotein (VLDL) receptor gene with sporadic Alzheimer's disease. Nature Genet. 11: 207- 209, 1995. ; and

Trommsdorff, M.; Gotthardt, M.; Hiesberger, T.; Shelton, J.; Stockinger, W.; Nimpf, J.; Hammer, R. E.; Richardson, J. A.; Herz, J. : Reeler/Disabled- like disruption of neuronal migration.

Further studies establishing the function and utilities of VLDLR are found in John Hopkins OMIM database record ID 192977, and in cited publications listed in Table 9, hereby incorporated herein.

GAM604 APBA1 GTGGCATTGGTGGTG Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A

GCATTGG 1 (X11) (APBA1, Accession NM_001163.2) is a GAM604 target gene. APBA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM604 is therefore inhibition of APBA1, a GAM604 target gene which stabilises APP and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA1.The function of APBA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM604 CRAT GTGGCATTGGTGGTG Carnitine Acetyltransferase (CRAT, Accession NM_004003.2) is A A

GCATTGG another GAM604 target gene. CRAT BINDING SITE1 and CRAT BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CRAT, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Nucleotide sequences of CRAT BINDING SITE1 and CRAT BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM604 is therefore inhibition of CRAT, a GAM604 target gene which catalyzes the reversible transfer of acyl groups from an acyl- CoA thioester to carnitine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRAT.The function of CRAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM604 CTNND2 GTGGCATTGGTGGTG GCATTGG Catenin (cadherin- associated protein), Delta 2 (neural plakophilin- rel (CTNND2, Accession NM_001332.1) is another GAM604 target gene. CTNND2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTNND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTNND2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM604 is therefore inhibition of CTNND2, a GAM604 target gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTNND2.The function of CTNND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM604 DHCR24 GTGGCATTGGTGGTG GCATTGG 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is another GAM604 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM604 is therefore inhibition of DHCR24, a GAM604 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been

established by previous studies, as described hereinabove with reference to GAM44.

GAM604	IL1B	GTGGCATTGGTGGTG GCATTGG	Interleukin 1, Beta (IL1B, Accession NM_000576.2) is another GAM604 target gene. IL1B BINDING SITE1 and IL1B BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IL1B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1B BINDING SITE1 and IL1B BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM604 is therefore inhibition of IL1B, a GAM604 target gene which stimulates thymocyte proliferation. and therefore is associated with Alzheimer. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1B.The function of IL1B has been established by previous studies. Interleukin- 1, produced mainly by blood monocytes, mediates the panoply of host reactions collectively known as acute phase response. It is identical to endogenous pyrogen. The multiple biologic activities that define IL1 are properties of a 15- to 18- kD protein that is derived from a 30- to 35- kD precursor. El- Omar et al. (2000) reported that interleukin- 1 gene cluster polymorphisms suspected of enhancing production of interleukin- 1- beta are associated with an increased risk of both hypochlorhydria induced by Helicobacter pylori and gastric cancer. Two of these polymorphisms are in near- complete linkage disequilibrium, and 1 is a TATA- box polymorphism that markedly affects DNA- protein interactions in vitro. The association with disease may be explained by the biologic properties of interleukin- 1- beta, which is an important proinflammatory cytokine and a powerful inhibitor of gastric acid secretion. Host genetic factors that affect interleukin- 1- beta may determine why some individuals infected with H. pylori develop gastric cancer while others do not. IL1- beta is upregulated in the presence of H. pylori and is important in initiating and amplifying the inflammatory response to this infection. Three diallelic polymorphisms in IL1B have been reported, all representing C- to- T base transitions, at positions - 511, - 31, and 3954 basepairs from the transcriptional start site. To determine whether these polymorphisms are important with respect to different outcomes of H. pylori infections, El- Omar et al. (2000) studied their effects on gastric physiology in healthy subjects. Carriers of the ILB - 31T allele (147720.0001) had an age- adjusted odds ratio of 9.1 (95% confidence interval, 2.2- 37) for low acid secretion, and there was little difference between homozygous and heterozygous carriers. The IL1B 3954 genotype was not associated with the risk of hypochlorhydria. Carriers of IL1B - 31T had an increased gastric cancer risk at an odds ratio of 1.9 (95% confidence interval, 1.5- 2.6), with no significant difference

between homozygotes and heterozygotes Hamajima et al. (2001) determined that the C- to- T transition at position - 31, creating a TATA box, is associated with vulnerability to persistent H. pylori infection, and that the susceptibility is modified by smoking Animal model experiments lend further support to the function of IL1B. Mature IL1- beta levels are a sensitive and specific indicator of caspase- 1 (OMIM Ref. No. 147678) activation. Ona et al. (1999) studied the effect of inhibition of caspase- 1 on the progression of Huntington disease (OMIM Ref. No. 143100) in the mouse model developed by Mangiarini et al. (1996), which they called R6/2 mice. Ona et al. (1999) crossed R6/2 mice with a well- characterized transgenic mouse strain expressing a dominant- negative mutant of caspase- 1 in the brain (NSE M17Z). Double mutant mice showed extended survival and delayed appearance of neuronal inclusions, neurotransmitter receptor alterations, and onset of symptoms, indicating that caspase- 1 is important in the pathogenesis of Huntington disease. Mature IL1- beta levels in R6/2 mice were elevated to 268% of those in wildtype controls. This increase was significantly inhibited in the R6/2- NSE M17Z mice. IL1- beta levels in the brains of human patients also exhibited significant increases, to 213% of those in normal controls

It is appreciated that the abovementioned animal model for IL1B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

El- Omar, E. M.; Carrington, M.; Chow, W.- H.; McColl, K. E. L.; Bream, J. H.; Young, H. A.; Herrera, J.; Lissowska, J.; Yuan, C.- C.; Rothman, N.; Lanyon, G.; Martin, M.; Fraumeni, J. F. Jr.; Rabkin, C. S. : Interleukin- 1 polymorphisms associated with increased risk of gastric cancer. Nature 404: 398- 402, 2000. Note: Erratum: Nature 412: 99 only, 2001. ; and

Ona, V. O.; Li, M.; Vonsattel, J. P. G.; Andrews, L. J.; Khan, S. Q.; Chung, W. M.; Frey, A. S.; Menon, A. S.; Li, X.- J.; Stieg, P. E.; Yuan, J.; Penney, J. B.; Young, A. B.; Cha, J.- H.

Further studies establishing the function and utilities of IL1B are found in John Hopkins OMIM database record ID 147720, and in cited publications listed in Table 9, hereby incorporated herein.

GAM604	MAPT	GTGGCATTGGTGGTG GCATTGG	Microtubule- associated Protein Tau (MAPT, Accession NM_016841.1) is another GAM604 target gene. MAPT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE	A	A

III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM604 is therefore inhibition of MAPT, a GAM604 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM604 NCKAP1 GTGGCATTGGTGGTG NCKAP1 (Accession NM_013436.2) is another GAM604 target gene. A A

GCATTGG NCKAP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM604 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM604 PRND GTGGCATTGGTGGTG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

GCATTGG another GAM604 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM604 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM604 is therefore inhibition of PRND, a GAM604 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM604 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM640 ACE GGCGTGATCTTGGCT Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A

CACCACA (ACE, Accession NM_152831.1) is a GAM640 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM640 is therefore inhibition of ACE, a GAM640 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM640 HTR2A GGCGTGATCTTGGCT 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession A A
CACCACA NM_000621.1) is another GAM640 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM640 is therefore inhibition of HTR2A, a GAM640 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM640 MAPT GGCGTGATCTTGGCT Microtubule- associated Protein Tau (MAPT, Accession A A
CACCACA NM_173727.1) is another GAM640 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM640 is therefore inhibition of MAPT, a GAM640 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM640 A A MTNR1A CACCACA GGCGTGATCTTGGCT Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is another GAM640 target gene. MTNR1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTNR1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM640 is therefore inhibition of MTNR1A, a GAM640 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM640 B A IAPP TCAAGCGATTCTCAT GCCTTAG Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM640 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM640 is therefore inhibition of IAPP, a GAM640 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM667 A A MAPT TGTAGGTGGTTGAGA GAATGAA Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is a GAM667 target gene. MAPT BINDING SITE1 and MAPT BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MAPT, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE1 and MAPT BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM667 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM667 is therefore inhibition of MAPT, a GAM667 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM667 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM667 MME TGTAGGTGGTTGAGA GAATGAA Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_000902.2) is another GAM667 target gene. MME BINDING SITE1 through MME BINDING SITE4 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MME, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, and secondary structure complementarity to the nucleotide sequence of GAM667 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM667 is therefore inhibition of MME, a GAM667 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM667 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM674 APLP2 TGAGATCATCGTTAC AAGCAGC Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession NM_001642.1) is a GAM674 target gene. APLP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM674 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM674 is therefore inhibition of APLP2, a GAM674 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM674 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 has been established by previous studies. Yan et al. (1990) cloned a cDNA that encoded a human sperm membrane protein identified by a monoclonal antibody raised against this protein and designated YWK- II. They found that the deduced polypeptide contains a segment with high homology to the transmembrane- cytoplasmic domains of the A4 amyloid protein (APP;

104760) found in brain plaques of Alzheimer disease patients. Rather than the lys- lys- lys sequence found in the A4 protein, an arg- lys- arg sequence was found at the probable membrane- cytoplasmic junction that may represent a unique property of sperm membrane proteins. The human amyloid precursor- like protein APLP2 is a highly conserved homolog of a sequence- specific DNA- binding mouse protein with an important function in the cell cycle. The mouse amyloid precursor- like protein Aplp1 has 42% sequence identity to mouse App; the human homolog of APLP1 (OMIM Ref. No. 104775) maps to 19q11- q13.2 (Wasco et al. 1993). By study of somatic cell hybrids segregating human chromosomes, von der Kammer et al. (1994) mapped the APLP2 gene to chromosome 11; by fluorescence in situ hybridization, the assignment was confirmed and further localized to 11q23- q25. By FISH, Leach et al. (1999) mapped the gene to 11q24.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Wasco, W.; Brook, J. D.; Tanzi, R. E. : The amyloid precursor-like protein (APLP) gene maps to the long arm of human chromosome 19. Genomics 15: 237- 239, 1993. ; and

Yan, Y. C.; Bai, Y.; Wang, L.; Miao, S.; Koide, S. S. : Characterization of cDNA encoding a human sperm membrane protein related to A4 amyloid protein. Proc. Nat. Acad. Sci. 87: 2405-240.

Further studies establishing the function and utilities of APLP2 are found in John Hopkins OMIM database record ID 104776, and in cited publications listed in Table 9, hereby incorporated herein.

GAM674 FHL2 TGAGATCATCGTTAC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

AAGCAGC another GAM674 target gene. FHL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM674 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM674 is therefore inhibition of FHL2, a GAM674 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM674 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to GAM189.

GAM689 APPBP2 ACTGCACTCCAGCCT GGGCAAC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM689 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM689 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM689 is therefore inhibition of APPBP2, a GAM689 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM689 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM689 BACE2 ACTGCACTCCAGCCT GGGCAAC Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_012105.3) is another GAM689 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM689 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM689 is therefore inhibition of BACE2, a GAM689 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM689 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM689 FHL2 ACTGCACTCCAGCCT GGGCAAC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is another GAM689 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM689 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM689 is therefore inhibition of FHL2, a GAM689 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM689 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM689 IGF1 ACTGCACTCCAGCCT GGGCAAC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM689 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM689 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM689 is therefore inhibition of IGF1, a GAM689 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM689 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM689 MME ACTGCACTCCAGCCT GGGCAAC Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_000902.2) is another GAM689 target gene. MME BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM689 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM689 is therefore inhibition of MME, a GAM689 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM689 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM689 PRND ACTGCACTCCAGCCT GGGCAAC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM689 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA A A

encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM689 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM689 is therefore inhibition of PRND, a GAM689 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM689 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM744 A A AGTAGCC BACE AAAATGCTTACAGGC Beta- site APP- cleaving Enzyme (BACE, Accession NM_138973.1) is a GAM744 target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM744 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM744 is therefore inhibition of BACE, a GAM744 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM744 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM744 A A AGTAGCC CAV2 AAAATGCTTACAGGC Caveolin 2 (CAV2, Accession NM_001233.2) is another GAM744 target gene. CAV2 BINDING SITE1 through CAV2 BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by CAV2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV2 BINDING SITE1 through CAV2 BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM744 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM744 is therefore inhibition of CAV2, a GAM744 target gene which may function as an accessory protein in conjunction with caveolin- 1and act as a scaffolding protein within caveolar membranes. and therefore is associated with

Alzheimer. Accordingly, utilities of GAM744 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV2.The function of CAV2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM750 A A BACE AGGGGTA TTCTCATTGGCCCAC Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) is a GAM750 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM750 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM750 is therefore inhibition of BACE, a GAM750 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM750 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM760 A A GFAP AACAGCA AGTCAGACGTTTGGC GFAP (Accession NM_002055.2) is a GAM760 target gene. GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM760 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM760 is therefore inhibition of GFAP. Accordingly, utilities of GAM760 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM760 A A HD AACAGCA AGTCAGACGTTTGGC HD (Accession NM_002111.3) is another GAM760 target gene. HD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM760 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM760 is therefore inhibition of HD. Accordingly, utilities of GAM760 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical

conditions associated with HD.

GAM760 A A SNCA AGTCAGACGTTTGGC AACAGCA SNCA (Accession NM_007308.1) is another GAM760 target gene. SNCA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM760 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM760 is therefore inhibition of SNCA. Accordingly, utilities of GAM760 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM760 A A TFCP2 AGTCAGACGTTTGGC AACAGCA Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is another GAM760 target gene. TFCP2 BINDING SITE1 and TFCP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TFCP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE1 and TFCP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM760 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM760 is therefore inhibition of TFCP2, a GAM760 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM760 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 has been established by previous studies. Lambert et al. (2000) reported an association between a noncoding polymorphism (G- A) in the 3- prime untranslated region of TFCP2 and sporadic Alzheimer disease (AD5; 602096) in French and British populations and a similar trend in a North American population. The combined analysis of the 3 independent populations suggested a protective effect of the A allele (OR = 0.58, 95% CI 0.44- 0.75). The A allele demonstrated reduced binding to nuclear protein(s) from a neuroblastoma cell line, and absence of the A allele was associated with lower gene expression in lymphocytes from AD cases compared with controls. The authors suggested that polymorphic variation in TFCP2 may be important for the pathogenesis of AD, particularly since the gene product interacts with proteins such as GSK3B (OMIM Ref. No. 605004), Fe65 (OMIM Ref. No. 602709), and certain factors involved in the inflammatory response. Swendeman et al. (1994) characterized the genomic structure, chromosome location, promoter, and expression pattern of CP2, a 66- kD cellular transcription factor that interacts with the alpha- globin (OMIM

Ref. No. 141800) promoter as well as with additional cellular and viral promoter elements. Homodimers of CP2, together with a 45- kD partner protein, form the so- called stage selector protein complex (Jane et al. 1995) that binds to a proximal gamma- globin gene promoter regulatory sequence, termed the stage selector element (SSE). The SSE is thought to be involved in silencing beta globin gene (OMIM Ref. No. 141900) transcription during fetal erythropoiesis (Cunningham et al. 1995).

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Swendeman, S. L.; Spielholz, C.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Sheffery, M. : Characterization of the genomic structure, chromosomal location, promoter, and developmental expression of the alpha- globin transcription factor CP2. J. Biol. Chem. 269: 11663- 11671, 1994. ; and

Lambert, J.- C.; Goumidi, L.; Wavrant- De Vrieze, F.; Frigard, B.; Harris, J. M.; Cummings, A.; Coates, J.; Pasquier, F.; Cottel, D.; Gaillac, M.; St. Clair, D.; Mann, D. M. A.; Hardy, J.;.

Further studies establishing the function and utilities of TFCP2 are found in John Hopkins OMIM database record ID 189889, and in cited publications listed in Table 9, hereby incorporated herein.

GAM772 A APCS A GCCAGGATGAAGAGG AGGAGAA Amyloid P Component, Serum (APCS, Accession NM_001639.2) is a GAM772 target gene. APCS BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APCS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APCS BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM772 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM772 is therefore inhibition of APCS, a GAM772 target gene which can interact with dna and histones and may scavenge nuclear material released from damaged circulating cells. may also function as a calcium- dependent lectin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM772 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APCS.The function of APCS has been established by previous studies. Woo et al. (1987) found a genetic marker for susceptibility to amyloidosis in juvenile arthritis: an 8.8- kb RFLP band determined by a polymorphic DNA site 5- prime to the SAP gene. Homozygosity for the alternative 5.6- kb band was found in none of 28 amyloid patients. Among 19 juvenile arthritic patients without amyloidosis, the distribution of the polymorphism was the same as that in the normal group. With a RFLP

of the cloned mouse Sap gene, Whitehead et al. (1988) demonstrated that the gene maps to chromosome 1 in the same region specified by quantitative variation in Sap levels. They thought it might be significant that the same region includes CRP, SAP, and histone genes, all of which have products that interact with DNA. Animal model experiments lend further support to the function of APCS. Botto et al. (1997) generated mice with a targeted deletion of the SAP gene. Induction of reactive amyloidosis was retarded in these mice, demonstrating the participation of SAP in pathogenesis of amyloidosis in vivo and confirming that inhibition of SAP binding to amyloid fibrils is an attractive therapeutic target. Pepys et al. (2002) developed a drug that is a competitive inhibitor of SAP binding to amyloid fibrils. This palindromic compound also crosslinks and dimerizes SAP molecules, leading to their very rapid clearance by the liver and thus producing a marked depletion of circulating human SAP. Pepys et al. (2002) suggested that this mechanism of drug action potently removes SAP from human amyloid deposits in tissues and may provide a new therapeutic approach to both systemic amyloidosis and diseases associated with local amyloid, including Alzheimer disease (OMIM Ref. No. 104300) and type 2 diabetes (OMIM Ref. No. 125853).

It is appreciated that the abovementioned animal model for APCS is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Botto, M.; Hawkins, P. N.; Bickerstaff, M. C.; Herbert, J.; Bygrave, A. E.; McBride, A.; Hutchinson, W. L.; Tennent, G. A.; Walport, M. J.; Pepys, M. B. : Amyloid deposition is delayed in mice with targeted deletion of the serum amyloid P component gene. Nature Med. 3: 855- 859, 1997. ; and

Woo, P.; O'Brien, J.; Robson, M.; Ansell, B. M. : A genetic marker for systemic amyloidosis in juvenile arthritis. Lancet I: 767- 769, 1987.

Further studies establishing the function and utilities of APCS are found in John Hopkins OMIM database record ID 104770, and in cited publications listed in Table 9, hereby incorporated herein.

GAM772 ARHA GCCAGGATGAAGAGG Ras Homolog Gene Family, Member A (ARHA, Accession NM_001664.1) A A

AGGAGAA is another GAM772 target gene. ARHA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences

of ARHA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM772 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM772 is therefore inhibition of ARHA, a GAM772 target gene which regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. and therefore is associated with Alzheimer. Accordingly, utilities of GAM772 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ARHA.The function of ARHA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.

GAM772 MAPK10 GCCAGGATGAAGAGG AGGAGAA Mitogen- activated Protein Kinase 10 (MAPK10, Accession NM_138981.1) is another GAM772 target gene. MAPK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM772 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM772 is therefore inhibition of MAPK10, a GAM772 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM772 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM779 IGF1 TTGGTTGGTGATGAG CATTGAA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is a GAM779 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM779 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM779 is therefore inhibition of IGF1, a GAM779 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM779 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM779 A A MTNR1A TTGGTTGGTGATGAG CATTGAA Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is another GAM779 target gene. MTNR1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTNR1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM779 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM779 is therefore inhibition of MTNR1A, a GAM779 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM779 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM779 A A TRPM2 TTGGTTGGTGATGAG CATTGAA TRPM2 (Accession NM_003307.1) is another GAM779 target gene. TRPM2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM779 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM779 is therefore inhibition of TRPM2, a GAM779 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM779 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM785 A A MME AGAAGATCCCTGCTC TGAGTCA Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_000902.2) is a GAM785 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM785 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM785 is therefore inhibition of MME, a GAM785 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM785 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM801 CASP3 TTGTGCTTGTACTGA CCATGTA Caspase 3, Apoptosis- related Cysteine Protease (CASP3, Accession NM_032991.1) is a GAM801 target gene. CASP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CASP3 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM801 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM801 is therefore inhibition of CASP3, a GAM801 target gene which is one apoptosis- related cysteine protease and is important for the initiation of apoptotic cell death. and therefore is associated with Alzheimer. Accordingly, utilities of GAM801 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CASP3.The function of CASP3 has been established by previous studies. Nicholson et al. (1995) developed a potent peptide aldehyde inhibitor and showed that it prevents apoptotic events in vitro, suggesting that apopain/CPP32 is important for the initiation of apoptotic cell death.Apoptosis of human endothelial cells after growth factor deprivation is associated with rapid and dramatic upregulation of cyclin A- associated cyclin- dependent kinase- 2 (CDK2; 116953) activity. Levkau et al. (1998) showed that in apoptotic cells the carboxyl termini of the CDK inhibitors CDKN1A (OMIM Ref. No. 116899) and CDKN1B (OMIM Ref. No. 600778) are truncated by specific cleavage. The enzyme involved in this cleavage is CASP3 and/or a CASP3- like caspase. After cleavage, CDKN1A loses its nuclear localization sequence and exits the nucleus. Cleavage of CDKN1A and CDKN1B resulted in a substantial reduction in their association with nuclear cyclin- CDK2 complexes, leading to a dramatic induction of CDK2 activity. Dominant- negative CDK2, as well as a mutant CDKN1A resistant to caspase cleavage, partially suppressed apoptosis. These data suggested that CDK2 activation, through caspase- mediated cleavage of CDK inhibitors, may be instrumental in the execution of apoptosis following caspase activation. Animal model experiments lend further support to the function of CASP3. To analyze the function of CPP32 in vivo, Kuida et al. (1996) generated CPP32- deficient mice by homologous recombination. These mice, born at a frequency lower than expected by mendelian genetics, were smaller than their littermates and died at 1 to 3 weeks of age. Although their thymocytes retained normal

susceptibility to various apoptotic stimuli, brain development in CPP32- deficient mice was profoundly affected, and discernible by embryonic day 12, resulting in a variety of hypoplasias and disorganized cell deployment. These supernumerary cells were postmitotic and terminally differentiated by the postnatal stage. Pyknotic clusters at sites of major morphogenetic change during normal brain development were not observed in the mutant embryos, indicating increased apoptosis in the absence of CPP32. Thus, CPP32 was shown by Kuida et al. (1996) to play a critical role during morphogenetic cell death in the mammalian brain.

It is appreciated that the abovementioned animal model for CASP3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Kuida, K.; Zheng, T. S.; Na, S.; Kuan, C.; Yang, D.; Karasuyama, H.; Rakio, P.; Flavell, R. A. : Decreased apoptosis in the brain and premature lethality in CPP32- deficient mice. Nature 384: 368- 372, 1996. ; and

Nicholson, D. W.; Ali, A.; Thornberry, N. A.; Vaillancourt, J. P.; Ding, C. K.; Gallant, M.; Gareau, Y.; Griffin, P. R.; Labelle, M.; Lazebnik, Y. A.; Munday, N. A.; Raju, S. M.; Smulso.

Further studies establishing the function and utilities of CASP3 are found in John Hopkins OMIM database record ID 600636, and in cited publications listed in Table 9, hereby incorporated herein.

GAM801	CTNND2	TTGTGCTTGTACTGA CCATGTA	Catenin (cadherin- associated protein), Delta 2 (neural plakophilin- rel (CTNND2, Accession NM_001332.1) is another GAM801 target gene. CTNND2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTNND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTNND2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM801 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM801 is therefore inhibition of CTNND2, a GAM801 target gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM801 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTNND2.The function of CTNND2 and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to GAM550.

GAM801 MAPT TTGTGCTTGTACTGA CCATGTA Microtubule- associated Protein Tau (MAPT, Accession NM_005910.2) is another GAM801 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM801 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM801 is therefore inhibition of MAPT, a GAM801 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM801 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM807 NCKAP1 TAAGTGCTGCTGATT TTGGAAA NCKAP1 (Accession NM_013436.2) is a GAM807 target gene. NCKAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM807 RNA are set forth in Tables 6 and 7, hereby incorporated herein. NCKAP1 A A

A function of GAM807 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM807 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM821 AVP ACACAGGCCCAGAGA GGCAGTG AVP (Accession NM_000490.2) is a GAM821 target gene. AVP BINDING SITE1 and AVP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by AVP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE1 and AVP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM821 is therefore inhibition of AVP. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM821 CRAT ACACAGGCCCAGAGA GGCAGTG Carnitine Acetyltransferase (CRAT, Accession NM_144782.1) is another GAM821 target gene. CRAT BINDING SITE is a target binding A A

site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CRAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM821 is therefore inhibition of CRAT, a GAM821 target gene which catalyzes the reversible transfer of acyl groups from an acyl- CoA thioester to carnitine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRAT.The function of CRAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM821 CTSB ACACAGGCCCAGAGA A A GGCAGTG CTSB (Accession NM_001908.2) is another GAM821 target gene. CTSB BINDING SITE1 and CTSB BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CTSB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE1 and CTSB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM821 is therefore inhibition of CTSB. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM821 MAPT ACACAGGCCCAGAGA A A GGCAGTG Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM821 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM821 is therefore inhibition of MAPT, a GAM821 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM821 NCSTN ACACAGGCCCAGAGA NCSTN (Accession NM_015331.1) is another GAM821 target gene. A A

GGCAGTG NCSTN BINDING SITE1 and NCSTN BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NCSTN, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCSTN BINDING SITE1 and NCSTN BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM821 is therefore inhibition of NCSTN, a GAM821 target gene which has a central role in presenilin-mediated processing of beta- amyloid precursor protein (beta- APP, MIM 104760) and some aspects of notch (MIM 190198)/glp- 1 signaling in vivo. and therefore is associated with Alzheimer. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCSTN.The function of NCSTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM821 S100B ACACAGGCCCAGAGA S100 Calcium- binding Protein, Beta (neural) (S100B, Accession A A

GGCAGTG NM_006272.1) is another GAM821 target gene. S100B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of S100B BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM821 is therefore inhibition of S100B, a GAM821 target gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. and therefore is associated with Alzheimer. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with S100B.The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.

GAM821 SLC17A7 ACACAGGCCCAGAGA SOLUTE CARRIER FAMILY 17, MEMBER 7 (SLC17A7, Accession A A

GGCAGTG NM_020309.1) is another GAM821 target gene. SLC17A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC17A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC17A7 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM821 is therefore inhibition of SLC17A7, a GAM821 target gene which is a brain- specific Na-dependent inorganic phosphate cotransporter and therefore is associated with Alzheimer. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC17A7.The function of SLC17A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM821 SNCB ACACAGGCCCAGAGA GGCAGTG A A Synuclein, Beta (SNCB, Accession NM_003085.2) is another target gene. SNCB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM821 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM821 is therefore inhibition of SNCB, a GAM821 target gene which may inhibit phospholipase D2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM821 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCB.The function of SNCB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM828 APPBP2 ACACATCTAATGGCT GTGCTGA A A Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM828 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM828 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM828 is therefore inhibition of APPBP2, a GAM828 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM828 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM828 BLMH ACACATCTAATGGCT GTGCTGA A A Bleomycin Hydrolase (BLMH, Accession NM_000386.1) is another GAM828 target gene. BLMH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BLMH, corresponding

to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BLMH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM828 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM828 is therefore inhibition of BLMH, a GAM828 target gene which is a cysteine protease that inactivates bleomycin and therefore is associated with Alzheimer. Accordingly, utilities of GAM828 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BLMH.The function of BLMH has been established by previous studies. Using PCR- SSCP, Bromme et al. (1996) and Montoya et al. (1997) found a 1450A- G polymorphism of the BMH gene that resulted in an ile443- to- val (I443V) conserved amino acid substitution in the carboxy terminus of the protein (602403.0001). BMH is suspected of being the unknown beta secretase that cleaves off the amyloid beta fragment from the amyloid precursor protein (APP; 104760) associated with Alzheimer disease (AD). In pooled AD cases and controls, the frequency of the 1450A and 1450G alleles were statistically indistinguishable. The G/G homozygote genotype distribution, however, was significantly different between AD cases (12.7%) and controls (6.6%); (P less than 0.001). Significant differences were not seen in the A/A homozygote and A/G heterozygote genotype distributions. Further studies by Montoya et al. (1998) indicated that the frequency of the G/G homozygote was significantly higher in AD cases than in controls only in the non- APOE4 (see OMIM Ref. No. 107741) group (15.9% in cases vs 4.7% in controls). The odds ratio for developing AD with BMH G/G genotype in the absence of an APOE4 allele was 3.81; in the presence of an APOE4 allele, the odds ratio was 0.98. Farrer et al. (1998) were unable to confirm this association in a sample of 621 Caucasian Alzheimer patients drawn from 4 North American university-based research centers. Susceptibility to bleomycin- induced chromatid breaks in cultured peripheral blood lymphocytes may reflect the way a person deals with carcinogenic challenges (Hsu et al. 1989). This susceptibility, also referred to as mutagen sensitivity, has been found to be increased in patients with environmentally related cancers, including cancers of the head and neck, lung, and colon. In combination with carcinogenic exposure, this susceptibility can greatly influence cancer risk. Cloos et al. (1999) determined the number of bleomycin- induced breaks per cell for 135 healthy volunteers without cancer. These individuals were from 53 different pedigrees and included 25 monozygotic twin pairs, 14 pairs of dizygotics, and 14 families selected on the basis of a first- degree relative who was successfully treated for head and neck cancer and who had no sign of recurrence for at least 1 year. Results showed no evidence for the influence of a shared family environment on bleomycin- induced chromatid breaks. On the other hand, genetic influences were statistically significant and

accounted for 75% of the total variance.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Bromme, D.; Rossi, A. B.; Smeekens, S. P.; Anderson, D. C.; Payan, D. G. : Human bleomycin hydrolase: molecular cloning, sequencing, functional expression, and enzymatic characterization. Biochemistry 35: 6706- 6714, 1996. ; and

Hsu, T. C.; Johnston, D. A.; Cherry, L. M.; Ramkissoon, D.; Schantz, S. P.; Jessup, J. M.; Winn, R. J.; Shirley, L.; Furlong, C. : Sensitivity to genotoxic effects of bleomycin in human.

Further studies establishing the function and utilities of BLMH are found in John Hopkins OMIM database record ID 602403, and in cited publications listed in Table 9, hereby incorporated herein.

GAM828	MAPT	TCAGTTGATAGCAGA TGCTGTT	Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM828 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM828 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	B	A

Another function of GAM828 is therefore inhibition of MAPT, a GAM828 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM828 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM834	ACE	GGCAGGATCATAGCT CACTGCA	Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM834 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM834 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

A function of GAM834 is therefore inhibition of ACE, a GAM834 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with

Alzheimer. Accordingly, utilities of GAM834 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM834 HTR2A GGCAGGATCATAGCT 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession A A
CACTGCA NM_000621.1) is another GAM834 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM834 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM834 is therefore inhibition of HTR2A, a GAM834 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM834 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM840 APPBP2 TTGCACTCCAGCCTG Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
GGTAACA Protein 2 (APPBP2, Accession NM_006380.2) is a GAM840 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM840 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM840 is therefore inhibition of APPBP2, a GAM840 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM840 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM840 FHL2 TTGCACTCCAGCCTG Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A
GGTAACA another GAM840 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences

of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM840 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM840 is therefore inhibition of FHL2, a GAM840 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM840 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM840 IGF1 TTGCACTCCAGCCTG GGTAACA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM840 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM840 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM840 is therefore inhibition of IGF1, a GAM840 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM840 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM840 PRND TTGCACTCCAGCCTG GGTAACA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM840 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM840 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM840 is therefore inhibition of PRND, a GAM840 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM840 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM842 NGB GCTGAGACCACCCTT Neuroglobin (NGB, Accession NM_021257.2) is a GAM842 target A A

GCCTGCC gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM842 is therefore inhibition of NGB, a GAM842 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM842 TRPM2 GCTGAGACCACCCTT TRPM2 (Accession NM_003307.1) is another GAM842 target gene. A A

GCCTGCC TRPM2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of TRPM2, a GAM842 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM842 APBB2 GGCTGGGCATGGTGG Amyloid Beta (A4) Precursor Protein- binding, Family B, Member B A

CTCACGC 2 (Fe65- (APBB2, Accession NM_173075.1) is another GAM842 target gene. APBB2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of APBB2, a GAM842 target gene which Interacts with beta- amyloid

precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM842 AVP GGCTGGGCATGGTGG AVP (Accession NM_000490.2) is another GAM842 target gene. AVP B A

CTCACGC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of AVP. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM842 CTSB GGCTGGGCATGGTGG CTSB (Accession NM_147783.1) is another GAM842 target gene. B A

CTCACGC CTSB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CTSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of CTSB. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM842 GFAP GGCTGGGCATGGTGG GFAP (Accession NM_002055.2) is another GAM842 target gene. B A

CTCACGC GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of GFAP. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM842 IGF1 GGCTGGGCATGGTGG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession B A

CTCACGC NM_000618.2) is another GAM842 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of IGF1, a GAM842 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM842 PRND GGCTGGGCATGGTGG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is B A

CTCACGC another GAM842 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of PRND, a GAM842 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM842 TNF GGCTGGGCATGGTGG Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, B A

CTCACGC Accession NM_000594.2) is another GAM842 target gene. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM842 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM842 is therefore inhibition of TNF, a GAM842 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly, utilities of GAM842 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated

with TNF.The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM846 FOS TGCTTTAGTTCTTCT A A GAAGTGT V- fos FBJ Murine Osteosarcoma Viral Oncogene Homolog (FOS, Accession NM_005252.2) is a GAM846 target gene. FOS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FOS BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM846 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM846 is therefore inhibition of FOS, a GAM846 target gene which Transcription factor, acting with JUN, may alter DNA methylation and therefore is associated with Alzheimer. Accordingly, utilities of GAM846 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FOS.The function of FOS has been established by previous studies. Muller et al. (1983) reported that the level of the c- fos gene transcripts is 100- fold greater in human term fetal membranes than in other normal human tissues and cells. These levels of c- fos expression in human amniotic and chorionic cells are close to that of v- fos expression that results in the induction of osteosarcomas in mice and transformation of fibroblasts in vitro. The human c- fms gene (OMIM Ref. No. 164770) is expressed at high levels in term placenta and trophoblastic cells. Muller et al. (1983) suggested that the physiologic role of the proteins encoded by the FOS and FMS genes may be related to these embryo- derived cells whose primary functions are protection and nourishment of the human fetus. Using the technique of in situ hybridization, Dony and Gruss (1987) demonstrated that stage-specific expression of the FOS gene in mouse embryos is restricted to the perichondrial growth regions of the cartilaginous skeleton. The possibility of a defect in FOS in a skeletal dysplasia is raised by these findings Animal model experiments lend further support to the function of FOS. Stable expression of c- fos in mice has been demonstrated in developing bones and teeth, hematopoietic cells, germ cells, and the central nervous system. The gene product is thought to have an important role in signal transduction, cell proliferation, and differentiation. Wang et al. (1991) demonstrated that overexpression of the gene in transgenic and chimeric mice specifically affects bone, cartilage, and hematopoietic cell development. Wang et al. (1992) studied the effects of lack of c-fos by gene targeting in embryonic stem cells. They reported that mice heterozygous for lack of the gene appeared normal, although females exhibited a distorted transmission frequency. All homozygous fos - /- mice were growth- retarded, developed osteopetrosis with deficiencies in bone remodeling and tooth eruption, and had altered hematopoiesis. Johnson et al. (1992) found similar results.

Homozygous mutants showed reduced placental and fetal weights and significant loss of viability at birth. However, approximately 40% of the homozygous mutants survived and grew at normal rates until severe osteopetrosis, characterized by foreshortening of the long bones, ossification of the marrow space, and absence of tooth eruption, began to develop at approximately 11 days. Among other abnormalities, these mice showed delayed or absent gametogenesis, lymphopenia, and altered behavior. Despite these defects, many lived as long as their wildtype or heterozygous littermates (currently 7 months).

It is appreciated that the abovementioned animal model for FOS is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Dony, C.; Gruss, P. : Proto- oncogene c- fos expression in growth regions of fetal bone and mesodermal web tissue. Nature 328: 711- 714, 1987. ; and

Wang, Z.- Q.; Grigoriadis, A. E.; Mohle- Steinlein, U.; Wagner, E. F. : A novel target cell for c- fos- induced oncogenesis: development of chondrogenic tumours in embryonic stem cell chime.

Further studies establishing the function and utilities of FOS are found in John Hopkins OMIM database record ID 164810, and in cited publications listed in Table 9, hereby incorporated herein.

GAM869 A NGB A ACCTGGCCTGTAGGC AAGTCTT Neuroglobin (NGB, Accession NM_021257.2) is a GAM869 target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM869 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM869 is therefore inhibition of NGB, a GAM869 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM869 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM869 NOTCH1 ACCTGGCCTGTAGGC Notch (Drosophila) Homolog 1 (translocation- associated) A A

AAGTCTT (NOTCH1, Accession NM_017617.2) is another GAM869 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM869 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM869 is therefore inhibition of NOTCH1, a GAM869 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM869 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 has been established by previous studies. Cytogenetic studies have shown that chromosome 7 band q34- q35, which contains the gene for the beta T- cell receptor (OMIM Ref. No. 186930), is a common site for translocation in T- cell neoplasms. In a translocation t(7;9)(q34;q34.3) found in a case of acute T- cell lymphoblastic leukemia, Ellisen et al. (1991) found that the locus on chromosome 9 contains a gene highly homologous to the Drosophila gene 'Notch.' Transcripts of the human gene, for which they proposed the name TAN1 (an acronym for translocation- associated Notch homolog), and its murine counterpart were demonstrated in many normal human fetal and adult mouse tissues but were most abundant in lymphoid tissues. In t(7;9)(q34;q34.3) translocations from 3 cases of acute T- cell lymphoblastic leukemia, Ellisen et al. (1991) found breakpoints within 100 bp of an intron in TAN1, resulting in truncation of TAN1 transcripts. They interpreted the observations to indicate that TAN1 is important for normal lymphocyte function and that alterations in TAN1 play a role in the pathogenesis of some T- cell neoplasms. Milner et al. (1994) found that at least 1 Notch homolog is expressed in human bone marrow CD34 cells, a population enriched for hematopoietic precursors. On the basis of these findings, they suggested that members of the Notch family, including TAN1, may be involved in mediating cell- fate decisions during hematopoiesis. Animal model experiments lend further support to the function of NOTCH1. Huppert et al. (2000) mutated valine at position 1744 of the mouse Notch1 gene to glycine. This position is the site for proteolytic cleavage and is critical for Notch1 intracellular processing in tissue- culture cells. Huppert et al. (2000) generated homozygous animals carrying 2 germline mutations and compared these with mice who have 2 null alleles for Notch1 (Conlon et al. 1995). At embryonic day 8.5 to 10.5, homozygous embryos were detected at the expected mendelian frequency. Similar to the null alleles, embryo absorption was detected between embryonic day 10 and 12, and no homozygous embryos were recovered past embryonic day 12. These

results suggested that efficient Notch processing is necessary for the early embryonic developmental aspects of Notch activity. RT- PCR and immunoprecipitation showed comparable amounts of Notch mRNA and protein, respectively, in the processing- deficient embryos and their heterozygous and wildtype littermates. The phenotypes associated with the single point mutation resembled the null Notch1 phenotype, but with slightly reduced penetrance.

It is appreciated that the abovementioned animal model for NOTCH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Ellisen, L. W.; Bird, J.; West, D. C.; Soreng, A. L.; Reynolds, T. C.; Smith, S. D.; Sklar, J. : TAN- 1, the human homolog of the Drosophila Notch gene, is broken by chromosomal translocations in T lymphoblastic neoplasms. Cell 66: 649- 661, 1991. ; and

Huppert, S. S.; Le, A.; Schroeter, E. H.; Mumm, J. S.; Saxena, M. T.; Milner, L. A.; Kopan, R. : Embryonic lethality in mice homozygous for a processing- deficient allele of Notch1. Natu.

Further studies establishing the function and utilities of NOTCH1 are found in John Hopkins OMIM database record ID 190198, and in cited publications listed in Table 9, hereby incorporated herein.

GAM869 A A SNCG ACCTGGCCTGTAGGC AAGTCTT SYNUCLEIN, GAMMA (SNCG, Accession NM_003087.1) is another GAM869 target gene. SNCG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCG BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM869 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM869 is therefore inhibition of SNCG, a GAM869 target gene which plays a role in neurofilament network integrity and therefore is associated with Alzheimer. Accordingly, utilities of GAM869 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCG.The function of SNCG has been established by previous studies. The synuclein gene family comprises genes that are highly conserved between species. Lavedan et al. (1998) identified and characterized a novel member of the human synuclein gene family, gamma- synuclein (SNCG). The SNCG gene contains 5 exons and encodes a 127- amino acid protein that is

highly homologous to alpha- synuclein (SNCA; 163890) and beta-synuclein (SNCB; 602569). Northern blot analysis showed that the gene is principally expressed in the brain, particularly in the substantia nigra. Through a survey of an EST database, Lavedan et al. (1998) found that the SNCG gene may also be overexpressed in ovarian tumors. Ji et al. (1997) used a high- throughput direct-differential cDNA sequencing approach to identify genes differentially expressed in normal breast as compared with breast cancer. Of many putative differentially expressed genes, a breast cancer- specific gene, BCSG1, which was expressed in high abundance in a breast cancer cDNA library but scarcely at all in a normal breast cDNA library, was identified as a putative breast cancer marker. In situ hybridization analysis demonstrated stage- specific BCSG1 expression as follows: BCSG1 was undetectable in normal or benign breast lesions, showing partial expression in ductal carcinoma in situ, but was expressed at an extremely high level in advanced infiltrating breast cancer. The predicted amino acid sequence of the BCSG1 gene product had a significant homology to the nonamyloid beta protein fragment of Alzheimer disease amyloid protein (OMIM Ref. No. 163890). BCSG1 overexpression may indicate breast cancer malignant progression from benign or in situ carcinoma.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Ji, H.; Liu, Y. E.; Jia, T.; Wang, M.; Liu, J.; Xiao, G.; Joseph, B. K.; Rosen, C.; Shi, Y. E. : Identification of a breast cancer- specific gene, BCSG1, by direct differential cDNA sequencing. Cancer Res. 57: 759- 764, 1997. ; and

Lavedan, C.; Buchholtz, S.; Auburger, G.; Albin, R. L.; Athanassiadou, A.; Blancato, J.; Burguera, J. A.; Ferrell, R. E.; Kostic, V.; Leroy, E.; Leube, B.; Mota- Vieira, L.; and 9 others.

Further studies establishing the function and utilities of SNCG are found in John Hopkins OMIM database record ID 602998, and in cited publications listed in Table 9, hereby incorporated herein.

GAM892	BACE2	TATCTCTTGCCTTGA CCTCCTA	Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_012105.3) is a GAM892 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM892 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

A function of GAM892 is therefore inhibition of BACE2, a

GAM892 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM892 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM892 A A PSEN1 TATCTCTTGCCTTGA CCTCCTA PSEN1 (Accession NM_000021.2) is another GAM892 target gene. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM892 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM892 is therefore inhibition of PSEN1. Accordingly, utilities of GAM892 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM933 A A IL1A TTAGGGCAGGCATGA GAGAACT Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is a GAM933 target gene. IL1A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM933 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM933 is therefore inhibition of IL1A, a GAM933 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM933 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM933 A A TNFSF5 TTAGGGCAGGCATGA GAGAACT TNFSF5 (Accession NM_000074.1) is another GAM933 target gene. TNFSF5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFSF5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM933 RNA are set forth in Tables 6 and 7, hereby

incorporated herein.

Another function of GAM933 is therefore inhibition of TNFSF5. Accordingly, utilities of GAM933 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFSF5.

GAM965 SNCA AAGGTAGATAAAGGC SNCA (Accession NM_000345.2) is a GAM965 target gene. SNCA A A
TTCACGT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM965 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM965 is therefore inhibition of SNCA. Accordingly, utilities of GAM965 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM973 APPBP2 TATTGCTAAGAATTC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
AGGTAGT Protein 2 (APPBP2, Accession NM_006380.2) is a GAM973 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM973 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM973 is therefore inhibition of APPBP2, a GAM973 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM973 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM973 IGF1 TATTGCTAAGAATTC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
AGGTAGT NM_000618.2) is another GAM973 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM973 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM973 is therefore inhibition of IGF1, a GAM973 target gene which are structurally and functionally

related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM973 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM973 A A AGGTAGT NPY TATTGCTAAGAATTC Neuropeptide Y (NPY, Accession NM_000905.2) is another GAM973 target gene. NPY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NPY BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM973 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM973 is therefore inhibition of NPY, a GAM973 target gene which is implicated in the control of feeding and in the secretion of gonadotrophin- release hormone. and therefore is associated with Alzheimer. Accordingly, utilities of GAM973 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NPY.The function of NPY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM193.

GAM999 A A AACATTT FOS AGCTGCCAGTTGAAG V- fos FBJ Murine Osteosarcoma Viral Oncogene Homolog (FOS, Accession NM_005252.2) is a GAM999 target gene. FOS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FOS BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM999 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM999 is therefore inhibition of FOS, a GAM999 target gene which Transcription factor, acting with JUN, may alter DNA methylation and therefore is associated with Alzheimer. Accordingly, utilities of GAM999 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FOS.The function of FOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM846.

GAM1017 A A GTTGACA FHL2 ACTGCACTCCAGCCT Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is a GAM1017 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1017 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1017 is therefore inhibition of FHL2, a GAM1017 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1017 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1017 IGF1 ACTGCACTCCAGCCT GTTGACA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM1017 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1017 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1017 is therefore inhibition of IGF1, a GAM1017 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1017 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1017 PRND ACTGCACTCCAGCCT GTTGACA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM1017 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1017 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1017 is therefore inhibition of PRND, a GAM1017 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1017 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1032 CHAT CTAGACTGAAGCTCC Choline Acetyltransferase (CHAT, Accession NM_020984.1) is a A A
TTGAGGA GAM1032 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1032 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1032 is therefore inhibition of CHAT, a GAM1032 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1032 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1032 CTSK CTAGACTGAAGCTCC CTSK (Accession NM_000396.2) is another GAM1032 target gene. A A
TTGAGGA CTSK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSK BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1032 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1032 is therefore inhibition of CTSK. Accordingly, utilities of GAM1032 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSK.

GAM1032 MPO CTAGACTGAAGCTCC Myeloperoxidase (MPO, Accession NM_000250.1) is another GAM1032 A A
TTGAGGA target gene. MPO BINDING SITE1 and MPO BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MPO, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE1 and MPO BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1032 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1032 is therefore inhibition of MPO, a GAM1032 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1032 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and

clinical conditions associated with MPO.The function of MPO has been established by previous studies. Weil et al. (1988) found that the MPO gene was translocated to chromosome 15 in all cases of acute promyelocytic leukemia (subtype M3), which is consistently associated with the chromosomal translocation t(15;17)(q22;q11.2). In 2 of 4 cases examined by genomic blot analysis, rearrangement of the MPO gene was detected in leukemia cells. Weil et al. (1988) also suggested that MPO may be pivotal in the pathogenesis of APL. According to HGM10, the MPO gene is located at a distance from the breakpoint in APL, and the gene itself is probably usually not rearranged in APL. Myeloperoxidase has been detected in activated microglial macrophages and within amyloid plaques in the central nervous system. Using statistical analysis, Reynolds et al. (2000) examined the relationship between APOE (OMIM Ref. No. 107741) and MPO polymorphisms in the risk of Alzheimer disease (AD; 104300) in a genetically homogeneous Finnish population. They found that the presence of the MPO A allele in conjunction with APOE E4 significantly increased the risk of AD in men, but not in women (odds ratio for men with both alleles = 11.4 vs APOE E4 alone = 3.0). Reynolds et al. (2000) also found that estrogen receptor-alpha (OMIM Ref. No. 133430) binds to the MPO A promoter, which may explain the gender differences.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Reynolds, W. F.; Hiltunen, M.; Pirskanen, M.; Mannermaa, A.; Helisalmi, S.; Lehtovirta, M.; Alafuzoff, I.; Soininen, H. : MPO and APOE epsilon- 4 polymorphisms interact to increase risk for AD in Finnish males. Neurology 55: 1284- 1290, 2000. ; and

Weil, S. C.; Rosner, G. L.; Reid, M. S.; Chisholm, R. L.; Lemons, R. S.; Swanson, M. S.; Carrino, J. J.; Diaz, M. O.; Le Beau, M. M. : Translocation and rearrangement of myeloperoxida.

Further studies establishing the function and utilities of MPO are found in John Hopkins OMIM database record ID 606989, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1032 3	SERPINA TTGAGGA	CTAGACTGAAGCTCC	Serine (or cysteine) Proteinase Inhibitor, Clade A (alpha- 1 antiprotei	A	A

(SERPINA3, Accession NM_001085.2) is another GAM1032 target gene. SERPINA3 BINDING SITE1 and SERPINA3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SERPINA3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SERPINA3 BINDING SITE1 and SERPINA3 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1032 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1032 is therefore inhibition of SERPINA3, a GAM1032 target gene which is a member of the serpin family of serine protease inhibitors. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1032 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SERPINA3.The function of SERPINA3 has been established by previous studies. Alpha- 1- antichymotrypsin is a plasma protease inhibitor synthesized in the liver. It is a single glycopeptide chain of about 68,000 daltons and belongs to the class of serine protease inhibitors. In man, the normal serum level is about one- tenth that of alpha- 1- antitrypsin (PI; 107400), with which it shares nucleic acid and protein sequence homology (Chandra et al. 1983). Both are major acute phase reactants; their concentrations in plasma increase in response to trauma, surgery, and infection. Antithrombin III, which also is structurally similar to alpha- 1- antitrypsin, shows less sequence homology to antichymotrypsin and is not an acute phase reactant. Kelsey et al. (1988) cloned and analyzed the AACT gene, partly because of the possibility that genetic variation in other protease inhibitors may influence the prognosis in AAT deficiency. They isolated the AACT gene on a series of cosmid clones, with restriction mapping of about 70 kb around the gene.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Chandra, T.; Stackhouse, R.; Kidd, V. J.; Robson, K. J. H.; Woo, S. L. C. : Sequence homology between human alpha- 1- antichymotrypsin, alpha- 1- antitrypsin, and antithrombin III. Biochemistry 22: 5055- 5061, 1983. ; and

Kelsey, G. D.; Abeliovich, D.; McMahon, C. J.; Whitehouse, D.; Corney, G.; Povey, S.; Hopkinson, D. A.; Wolfe, J.; Mieli- Vergani, G.; Mowat, A. P. : Cloning of the human alpha- 1 antichym.

Further studies establishing the function and utilities of SERPINA3 are found in John Hopkins OMIM database record ID 107280, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1032 TNFRSF6 CTAGACTGAAGCTCC TNFRSF6 (Accession NM_152874.1) is another GAM1032 target gene. A A

TTGAGGA TNFRSF6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF6 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1032 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1032 is therefore inhibition of TNFRSF6. Accordingly, utilities of GAM1032 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF6.

GAM1033 BACE TTTTCAATGGCTGAC Beta- site APP- cleaving Enzyme (BACE, Accession NM_138972.1) A A
ACTGTCT is a GAM1033 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1033 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1033 is therefore inhibition of BACE, a GAM1033 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1033 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1087 CAV1 CAGTGGGAAAAGTTT Caveolin 1, Caveolae Protein, 22kD (CAV1, Accession A A
GTCTCAT NM_001753.3) is a GAM1087 target gene. CAV1 BINDING SITE1 and CAV1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CAV1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV1 BINDING SITE1 and CAV1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1087 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1087 is therefore inhibition of CAV1, a GAM1087 target gene which may act as a scaffolding protein within caveolar membranes, and interacts directly with g- protein alpha subunits and can functionally regulate their activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1087 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV1.The function of CAV1 has been established by previous studies. In addition to the role of mutations in CAV3 in limb- girdle muscular dystrophy, Engelman et al. (1998) reviewed the cell culture and biochemical findings suggesting that heritable differences in the interaction between caveolins and their partners may lead to other conditions as well. They reviewed the evidence that CAV1 is a tumor suppressor gene and a negative regulator of the Ras- p42/44 MAP kinase cascade. Loss of heterozygosity analysis implicates 7q31.1 in the pathogenesis of multiple types of cancer, including breast, ovarian, prostate, and colorectal carcinoma, as well as uterine

sarcomas and leiomyomas. Yang et al. (1998) found elevated caveolin-1 levels associated with lymph node metastasis in prostate cancer (OMIM Ref. No. 176807), raising the possibility that CAV1 may also act as an oncogene. Because the closest known gene to CAV1 is the MET protooncogene (OMIM Ref. No. 164860), however, this finding may simply reflect coamplification of CAV1 along with MET. MET was first identified and cloned as a metastasis- associated gene (Giordano et al. 1989). Animal model experiments lend further support to the function of CAV1. By targeted disruption of caveolin- 1, Drab et al. (2001) generated mice that lacked caveolae. The absence of this organelle impaired nitric oxide and calcium signaling in a cardiovascular system, causing aberrations in endothelium- dependent relaxation, contractility, and maintenance of myogenic tone. In addition, the lungs of knockout mice displayed thickening of alveolar septa caused by uncontrolled endothelial cell proliferation and fibrosis, resulting in severe physical limitations in caveolin-1- disrupted mice. Thus, Drab et al. (2001) concluded that caveolin-1 and caveolae play a fundamental role in organizing multiple signaling pathways in the cell.

It is appreciated that the abovementioned animal model for CAV1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Yang, G.; Truong, L. D.; Timme, T. L.; Ren, C.; Wheeler, T. M.; Park, S. H.; Nasu, Y.; Bangma, C. H.; Kattan, M. W.; Scardino, P. T.; Thompson, T. C. : Elevated expression of caveolin is associated with prostate and breast cancer. Clin. Cancer Res. 4: 1873- 1880, 1998. ; and

Drab, M.; Verkade, P.; Elger, M.; Kasper, M.; Lohn, M.; Lauterbach, B.; Menne, J.; Lindschau, C.; Mende, F.; Luft, F. C.; Schedl, A.; Haller, H.; Kurzchalia, T. V. : Loss of caveolae, va.

Further studies establishing the function and utilities of CAV1 are found in John Hopkins OMIM database record ID 601047, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1087 A GYPA CAGTGGGAAAAGTTT A GTCTCAT Glycophorin A (includes MN blood group) (GYPA, Accession NM_002099.2) is another GAM1087 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1087 RNA are set

forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1087 is therefore inhibition of GYPA, a GAM1087 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1087 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1087 HD CAGTGGGAAAAGTTT HD (Accession NM_002111.3) is another GAM1087 target gene. HD A A

GTCTCAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1087 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1087 is therefore inhibition of HD. Accordingly, utilities of GAM1087 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM1087 MME CAGTGGGAAAAGTTT Membrane Metallo- endopeptidase (neutral endopeptidase, A A

GTCTCAT enkephalinase, (MME, Accession NM_007287.1) is another GAM1087 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1087 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1087 is therefore inhibition of MME, a GAM1087 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1087 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1088 ADAM17 GAAGAGCTGTGTGCT A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A

GTGATGT factor, (ADAM17, Accession NM_003183.3) is a GAM1088 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure

complementarity to the nucleotide sequence of GAM1088 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1088 is therefore inhibition of ADAM17, a GAM1088 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1088 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1089 APBA1 GGGAGGATCCTTGCT Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A

CAACTTA 1 (X11) (APBA1, Accession NM_001163.2) is a GAM1089 target gene. APBA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1089 is therefore inhibition of APBA1, a GAM1089 target gene which stabilises APP and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA1.The function of APBA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM1089 GLUL GGGAGGATCCTTGCT Glutamate- ammonia Ligase (glutamine synthase) (GLUL, Accession A A

CAACTTA NM_002065.3) is another GAM1089 target gene. GLUL BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GLUL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GLUL BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of GLUL, a GAM1089 target gene which catalyzes the condensation of glutamate and ammonia to form glutamine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GLUL.The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to GAM519.

GAM1089 TFCP2 GGGAGGATCCTTGCT Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is A A

CAACTTA another GAM1089 target gene. TFCP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TFCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of TFCP2, a GAM1089 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM760.

GAM1089 ACE GTGTGGGCAGGGCCG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 B A

TGCTCCC (ACE, Accession NM_152831.1) is another GAM1089 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of ACE, a GAM1089 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1089 BACE2 GTGTGGGCAGGGCCG Beta- site APP- cleaving Enzyme 2 (BACE2, Accession B A

TGCTCCC NM_138992.1) is another GAM1089 target gene. BACE2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of BACE2, a GAM1089 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1089 CHAT GTGTGGGCAGGGCCG Choline Acetyltransferase (CHAT, Accession NM_020985.1) is B A

TGCTCCC another GAM1089 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of CHAT, a GAM1089 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1089 GFAP GTGTGGGCAGGGCCG GFAP (Accession NM_002055.2) is another GAM1089 target gene. B A

TGCTCCC GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of GFAP. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM1089 PRND GTGTGGGCAGGGCCG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is B A

TGCTCCC another GAM1089 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7,

hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of PRND, a GAM1089 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1089 TGFB1 GTGTGGGCAGGGCCG TGFB1 (Accession NM_000660.1) is another GAM1089 target gene. B A

TGCTCCC TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1089 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1089 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1099 HTR2C CTGTTCAGATCTGTG 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession A A

TGCATTT NM_000868.1) is a GAM1099 target gene. HTR2C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1099 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1099 is therefore inhibition of HTR2C, a GAM1099 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1099 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM1144 APBB2 TCTTGGTGCTTTTGC Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

TGGATGA 2 (Fe65- (APBB2, Accession NM_173075.1) is a GAM1144 target gene. APBB2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING

SITE, and secondary structure complementarity to the nucleotide sequence of GAM1144 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1144 is therefore inhibition of APBB2, a GAM1144 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1144 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1144 APOC1 TCTTGGTGCTTTTGC Apolipoprotein C- I (APOC1, Accession NM_001645.2) is another A A

TGGATGA GAM1144 target gene. APOC1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APOC1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APOC1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1144 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1144 is therefore inhibition of APOC1, a GAM1144 target gene which appears to modulate the interaction of apoe with beta- migrating vldl and inhibit binding of beta- vldl to the ldl receptor- related protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1144 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APOC1.The function of APOC1 has been established by previous studies. Smit et al. (1988) presented a map of the apolipoprotein E- C1- C2 gene cluster on chromosome 19: 5- prime- - APOE- - 4.3 kb- - APOC1- - 6 kb- - APOC1 pseudogene- - about 22 kb- - APOC2- - 3- prime. Thus, the cluster spans approximately 48 kb. This gene order and the size of the cluster were confirmed by Myklebost and Rogne (1988) by pulsed-field gel electrophoresis mapping methods. A HpaI RFLP in the APOE-C1- C2 gene cluster on chromosome 19 is strongly associated with familial dysbetalipoproteinemia. Smit et al. (1988) showed that this RFLP site is between APOE and APOC1 and specifically that it is located 317 bp upstream of the transcription initiation site of the APOC1 gene. They constructed a detailed restriction map of the gene cluster, showing that the APOC2 gene is located 15 kb downstream of the APOC1 pseudogene. Although Trask et al. (1993) did not map the APOC1 gene directly, the mapping of the APOE and APOC2 genes to 19q13.2 by fluorescence in situ hybridization established that the APOC1 gene is also in this band. Animal model experiments lend further support to the function of APOC1. To determine the relationship between APOC1 and CETP (OMIM Ref. No. 118470), Gautier et al. (2002) crossed transgenic mice expressing human CETP with

Apoc1 null mice. The high density lipoproteins (HDLs) of these crosses contained 50% less cholesteryl esters and showed a decreased cholesteryl ester- to- triglyceride ratio. The mean apparent diameter of LDLs from these mice was also significantly reduced. In vitro, purified Apoc1 inhibited cholesteryl ester exchange when added to either total plasma or to reconstituted HDL- free mixtures. Gautier et al. (2002) concluded that APOC1 is a specific inhibitor of CETP.

It is appreciated that the abovementioned animal model for APOC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Gautier, T.; Masson, D.; Jong, M. C.; Duverneuil, L.; Le Guern, N.; Deckert, V.; Pais de Barros, J.- P.; Dumont, L.; Bataille, A.; Zak, Z.; Jiang, X.- C.; Tall, A. R.; Havekes, L. M.; Lagrost, L. : Apolipoprotein CI deficiency markedly augments plasma lipoprotein changes mediated by human cholesteryl ester transfer protein (CETP) in CETP transgenic/ApoCI- knocked out mice. J. Biol. Chem. 277: 31354- 31363, 2002. ; and

Smit, M.; van der Kooij- Meijs, E.; Woudt, L. P.; Havekes, L. M.; Frants, R. R. : Exact localization of the familial dysbetalipoproteinemia associated HpaI restriction site in the promo.

Further studies establishing the function and utilities of APOC1 are found in John Hopkins OMIM database record ID 107710, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1144 CHAT TCTTGGTGCTTTTGC Choline Acetyltransferase (CHAT, Accession NM_020986.1) is A A TGGATGA another GAM1144 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1144 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1144 is therefore inhibition of CHAT, a GAM1144 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1144 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1144	CLU	TCTTGGTGCTTTTGC TGGATGA	Clusterin (complement lysis inhibitor, SP- 40,40, sulfated glycoprotein (CLU, Accession NM_001831.1) is another GAM1144 target gene. CLU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CLU BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1144 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM1144 is therefore inhibition of CLU, a GAM1144 target gene which has a role in the terminal complement reaction. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1144 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CLU.The function of CLU has been established by previous studies. Sulfated glycoprotein- 2 (SGP- 2) is the major secreted product of Sertoli cells and is thought to play a critical role in spermatogenesis. Murphy et al. (1988) described a novel serum protein, SP- 40,40, using a series of monoclonal antibodies directed to the immune deposit- containing glomerular basement membranes of a patient with membranous glomerulonephritis. The protein was shown to be a normal constituent of human blood. It consists of two 40- kD chains, alpha and beta, covalently joined by disulfide bonds. They established that SP- 40,40 is a member of the human complement system by directly demonstrating its presence within the S- protein- containing soluble variant of the C5b- 9 complex, SC5b- 9. SP- 40,40 is also called complement lysis inhibitor. It acts as a control mechanism of the complement cascade; specifically, it prevents the binding of a C5b- C7 complex to the membrane of the target cell and in this way inhibits complement- mediated cytolysis . Animal model experiments lend further support to the function of CLU. Following neonatal hypoxic- ischemic brain injury in mice (a model of cerebral palsy), there is evidence of apoptotic changes such as activation of neuronal caspase- 3 (OMIM Ref. No. 600636), as well as an accumulation of clusterin in dying neurons. Han et al. (2001) generated mice deficient in clusterin by targeted disruption. Clusterin - /- mice had 50% less brain injury following neonatal hypoxia- ischemia. The absence of clusterin had no effect on caspase- 3 activation, and clusterin accumulation and caspase- 3 activation did not colocalize to the same cells. Studies with cultured cortical neurons demonstrated that exogenous purified astrocyte- secreted clusterin exacerbated oxygen/glucose- deprivation- induced necrotic death. Han et al. (2001) concluded that clusterin may be a therapeutic target to modulate noncaspase- dependent neuronal death following acute brain injury

It is appreciated that the abovementioned animal model for CLU is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Murphy, B. F.; Kirszbaum, L.; Walker, I. D.; d'Apice, A. J. F. : SP- 40,40, a newly identified normal human serum protein found in the SC5b- 9 complex of complement and in the immune deposits in glomerulonephritis. J. Clin. Invest. 81: 1858- 1864, 1988. ; and

Han, B. H.; DeMattos, R. B.; Dugan, L. L.; Kim- Han, J. S.; Brendza, R. P.; Fryer, J. D.; Kierson, M.; Cirrito, J.; Quick, K.; Harmony, J. A. K.; Aronow, B. J.; Holtzman, D. M. : Cluster.

Further studies establishing the function and utilities of CLU are found in John Hopkins OMIM database record ID 185430, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1163 ACE CTGCATGGAGGTGGT CTATGAG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM1163 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1163 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1163 is therefore inhibition of ACE, a GAM1163 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM1163 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1191 ACHE CTGGGCGTGTGAGGC GGCTGTG Acetylcholinesterase (YT blood group) (ACHE, Accession NM_015831.1) is a GAM1191 target gene. ACHE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ACHE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACHE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1191 RNA are set forth in Tables 6 and 7, hereby incorporated A A

herein.

A function of GAM1191 is therefore inhibition of ACHE, a GAM1191 target gene which rapidly hydrolyzes choline released into the synapse. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1191 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACHE.The function of ACHE has been established by previous studies. Coates and Simpson (1972) concluded that 3 phenotypic variants of acetylcholinesterase (EC 3.1.1.7) result from 2 codominant alleles at a single locus. Rotundo et al. (1988) showed that all the forms of acetylcholinesterase observed in avian nerves and muscle are encoded by a single autosomal gene. Differences in assembly and localization of the multiple synaptic forms of acetylcholinesterase are thought to arise through posttranscriptional events. Lapidot- Lifson et al. (1989) referred to the cloning of the gene for acetylcholinesterase. They used these clones to study the coamplification of acetylcholinesterase and pseudocholinesterase (butyrylcholinesterase; BCHE; 177400). Their coamplification in certain leukemias and in disorders of platelet formation suggest that the 2 loci may be linked. (The pseudocholinesterase gene is located at 3q25.2.) Whereas pseudocholinesterase is a soluble plasma enzyme presumed to be produced by the liver but also present in muscle and brain, acetylcholinesterase or 'true' cholinesterase is involved in the signal transmission at neuromuscular junctions and is also intensely expressed in the human central nervous system and the erythrocyte membrane. That such was the case was demonstrated by Getman et al. (1992). By chromosomal in situ suppression hybridization analysis, they showed that a single gene is located at 7q22 and confirmed the results by PCR analysis of genomic DNA from a human/hamster somatic cell hybrid containing a single human chromosome 7. Thus the gene maps to the same region that is frequently the site of nonrandom deletion in leukemias of myeloid cell precursors known to express acetylcholinesterase during normal differentiation. Animal model experiments lend further support to the function of ACHE. Feng et al. (1999) generated ColQ (OMIM Ref. No. 603033) - /- mice to study the roles played by ColQ and AChE in synapses and elsewhere.

It is appreciated that the abovementioned animal model for ACHE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Lapidot- Lifson, Y.; Prody, C. A.; Ginzberg, D.; Meytes, D.; Zakut, H.; Soreq, H. : Coamplification of human acetylcholinesterase

and butyrylcholinesterase genes in blood cells: correlation with various leukemias and abnormal megakaryocytopoiesis. Proc. Nat. Acad. Sci. 86: 4715- 4719, 1989. ; and

Feng, G.; Krejci, E.; Molgo, J.; Cunningham, J. M.; Massoulie, J.; Sanes, J. R. : Genetic analysis of collagen Q: roles in acetylcholinesterase and butyrylcholinesterase assembly and in.

Further studies establishing the function and utilities of ACHE are found in John Hopkins OMIM database record ID 100740, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1191 FHL2 CTGGGCGTGTGAGGC A A GGCTGTG Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is another GAM1191 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1191 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1191 is therefore inhibition of FHL2, a GAM1191 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1191 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1191 MME CTGGGCGTGTGAGGC A A GGCTGTG Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_000902.2) is another GAM1191 target gene. MME BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1191 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1191 is therefore inhibition of MME, a GAM1191 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1191 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1191 PSEN1 CTGGGCGTGTGAGGC A A PSEN1 (Accession NM_007318.1) is another GAM1191 target gene.

GGCTGTG PSEN1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1191 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1191 is therefore inhibition of PSEN1. Accordingly, utilities of GAM1191 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM1191 SERPINA CTGGGCGTGTGAGGC Serine (or cysteine) Proteinase Inhibitor, Clade A (alpha- 1 A A
3 GGCTGTG antiprotei (SERPINA3, Accession NM_001085.2) is another GAM1191 target gene. SERPINA3 BINDING SITE1 and SERPINA3 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SERPINA3, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SERPINA3 BINDING SITE1 and SERPINA3 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1191 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1191 is therefore inhibition of SERPINA3, a GAM1191 target gene which is a member of the serpin family of serine protease inhibitors. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1191 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SERPINA3.The function of SERPINA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM1191 SNCB CTGGGCGTGTGAGGC Synuclein, Beta (SNCB, Accession NM_003085.2) is another A A
GGCTGTG GAM1191 target gene. SNCB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SNCB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1191 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1191 is therefore inhibition of SNCB, a GAM1191 target gene which may inhibit phospholipase D2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1191 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCB.The function of SNCB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM1193 ACE CACCCAGGCTGGAGT Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A
GCAGTGG (ACE, Accession NM_152831.1) is a GAM1193 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1193 is therefore inhibition of ACE, a GAM1193 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM1193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1193 ADAM17 CACCCAGGCTGGAGT A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A
GCAGTGG factor, (ADAM17, Accession NM_021832.1) is another GAM1193 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1193 is therefore inhibition of ADAM17, a GAM1193 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1193 FLNB CACCCAGGCTGGAGT Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession A A
GCAGTGG NM_001457.1) is another GAM1193 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1193 is therefore inhibition of FLNB, a GAM1193 target gene which Filamin B, beta; binds actin,

interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB has been established by previous studies. The platelet GpIb complex (see OMIM Ref. No. 138720) mediates the adherence of platelets at the site of vascular injury through the binding of GpIb- alpha (OMIM Ref. No. 231200) to subendothelial von Willebrand factor (VWF; 193400). In platelets, the GpIb complex is tightly bound to the actin cytoskeleton via an interaction of GpIb- alpha with ABP280 (filamin A; 300017). Using a yeast 2- hybrid screen with the cytoplasmic tail of GpIb- alpha as bait, Takafuta et al. (1998) isolated partial cDNAs encoding a novel filamin homolog that they designated beta- filamin. They used the partial cDNAs to screen a placenta library and recovered additional cDNAs corresponding to the entire beta- filamin coding region. Like ABP280, the predicted 2,602- amino acid protein contains an N- terminal actin- binding domain, a backbone of 24 tandem repeats, and 2 hinge regions. Excluding the unique first hinge region of beta- filamin, the sequences of beta- filamin and ABP280 are 70% identical. Antibodies against beta- filamin detected a 280- kD protein on Western blots of human umbilical vein endothelial cell (HUVEC) extracts and stained normal human endothelial cells in culture and in situ. Using antigen- capture ELISA, Takafuta et al. (1998) found that beta- filamin associates with GpIb- alpha in both platelets and HUVEC extracts. They determined that the GpIb- alpha- binding domain in beta- filamin is in repeats 17- 20, a region that corresponds to the GpIb- alpha- binding domain in ABP280. Northern blot analysis revealed that beta- filamin is expressed as 2 approximately 9.5- kb mRNAs in many adult tissues. The 2 different transcripts appear to result from use of alternative polyadenylation signals. Takafuta et al. (1998) concluded that beta- filamin is a new member of the filamin family that may have significance for GpIb- alpha function in endothelial cells and platelets. Independently, Xu et al. (1998) isolated cDNAs encoding beta- filamin, which they referred to as ABP278. These authors also identified alternatively spliced mRNAs encoding ABP276, a beta- filamin isoform missing the first hinge region. RT- PCR analysis indicated that the 2 isoforms were expressed at different relative levels in various human tissues. The addition of thyroid- stimulating hormone (TSH; OMIM Ref. No. 188530) to cultured thyroid follicular cells induces rapid and profound disruption of actin microfilaments. Using serum from a Graves disease (OMIM Ref. No. 275000) patient, Leedman et al. (1993) identified a thyroid cDNA encoding TABP (truncated actin- binding protein), a predicted 195- amino acid protein with homology to the C terminus of ABP280. Both Xu et al. (1998) and Takafuta et al. (1998) considered TABP to be a truncated form of beta- filamin. Mutations in the presenilin genes PS1 (OMIM Ref. No. 104311) and PS2 (OMIM Ref. No. 600759) account for approximately 50% of early- onset familial Alzheimer disease (AD; 104300). Zhang et al. (1998)

identified beta- filamin as filamin homolog 1 (FH1), a filamin-related protein that interacts with the loop regions of PS1 and PS2. A monoclonal antibody recognizing both ABP280 and FH1 bound to blood vessels and astrocytes in the normal brain. In the brains of AD patients, Zhang et al. (1998) observed staining also in neurofibrillary tangles, neuropil threads, and dystrophic neurites within some senile plaques. The authors stated that detection of these presenilin- interacting proteins in these brain structures suggests that ABP280 and FH1 may be involved in the development of AD and that interactions between presenilins and ABP280/FH1 may be functionally significant. Takafuta et al. (1998) noted that the FH1 sequence is identical to the C- terminal 291 amino acids of beta-filamin except for 2 residues, making it very likely that FH1 represents the C- terminal region of beta- filamin. By analysis of somatic cell hybrids, Zhang et al. (1998) mapped the FH1 gene to chromosome 3. Takafuta et al. (1998) refined the map position to 3p21.1- p14.3 based on inclusion of a previously mapped STS within the beta- filamin sequence. By FISH, Brocker et al. (1999) assigned the FLNB gene to 3p14.3. Chakarova et al. (2000) mapped FLNB to 3p14 by radiation hybrid analysis.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Brocker, F.; Bardenheuer, W.; Vieten, L.; Julicher, K.; Werner, N.; Marquitan, G.; Michael, D.; Opalka, B.; Schutte, J. : Assignment of human filamin gene FLNB to human chromosome band 3p14.3 and identification of YACs containing the complete FLNB transcribed region. Cytogenet. Cell Genet. 85: 267- 268, 1999. ; and

Chakarova, C.; Wehnert, M. S.; Uhl, K.; Sakthivel, S.; Vosberg, H.- P.; van der Ven, P. F. M.; Furst, D. O. : Genomic structure and fine mapping of the two human filamin gene paralogues.

Further studies establishing the function and utilities of FLNB are found in John Hopkins OMIM database record ID 603381, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1193 A A FPRL1 GCAGTGG CACCCAGGCTGGAGT FPRL1 (Accession NM_001462.1) is another GAM1193 target gene. FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1193 is therefore inhibition of FPRL1. Accordingly, utilities of GAM1193 include diagnosis,

prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM1193 IAPP CACCCAGGCTGGAGT Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is A A GCAGTGG another GAM1193 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1193 is therefore inhibition of IAPP, a GAM1193 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM1193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1193 TGFB1 CACCCAGGCTGGAGT TGFB1 (Accession NM_000660.1) is another GAM1193 target gene. A A GCAGTGG TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1193 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1193 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1193 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1197 MPO TGTCAGTTTTTTAAA Myeloperoxidase (MPO, Accession NM_000250.1) is a GAM1197 A A TACTCAG target gene. MPO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1197 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1197 is therefore inhibition of MPO, a GAM1197 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1197 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and

clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM1197	SOD2	TGTCAGTTTTTTAAA TACTCAG	Superoxide Dismutase 2, Mitochondrial (SOD2, Accession NM_000636.1) is another GAM1197 target gene. SOD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SOD2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1197 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM1197 is therefore inhibition of SOD2, a GAM1197 target gene which is intramitochondrial free radical scavenging enzyme. When he has polymorphism in signal peptides he could couse diseases of distribution and therefore is associated with Alzheimer. Accordingly, utilities of GAM1197 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SOD2.The function of SOD2 has been established by previous studies. Rosenblum et al. (1996) emphasized the importance of polymorphism in signal peptides that target organelle- specific proteins to their subcellular sites of action. They discovered a polymorphism when they cloned the SOD2 gene from cell lines of normal individuals and patients with genetic diseases of premature aging. The polymorphism consisted of a single nucleotide change in the region of the DNA that encodes the signal sequence such that either an alanine or a valine was present (147460.0001). Rosenblum et al. (1996) suggested that such signal sequence polymorphism could result in diseases of distribution, where essential proteins are not properly targeted, thereby leading to absolute or relative deficiencies of critical enzymes within specific cellular compartments. They suggested that progeria (OMIM Ref. No. 176670) and related syndromes may be diseases of distribution. Hiroi et al. (1999) found an increased frequency for the SOD2- VV genotype (homozygosity for the valine (V) allele vs the alanine allele) in Japanese with nonfamilial idiopathic cardiomyopathy (IDC) and suggested that this polymorphism may collaborate with the DRP1*1401 allele of the HLA- DRB1 gene (OMIM Ref. No. 142857) in controlling the susceptibility to nonfamilial IDC

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Hiroi, S.; Harada, H.; Nishi, H.; Satoh, M.; Nagai, R.; Kimura, A. : Polymorphisms in the SOD2 and HLA- DRB1 genes are associated with nonfamilial idiopathic dilated cardiomyopathy in Japanese. Biochem. Biophys. Res. Commun. 261: 332- 339, 1999. ; and

Rosenblum, J. S.; Gilula, N. B.; Lerner, R. A. : On signal sequence polymorphisms and diseases of distribution. Proc. Nat. Acad. Sci. 93: 4471- 4473, 1996.

Further studies establishing the function and utilities of SOD2 are found in John Hopkins OMIM database record ID 147460, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1216 ADAMTS5 TACAGGCAGGCACAG A Disintegrin- like and Metalloprotease (reprolysin type) with A A

AGGCAGT Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM1216 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1216 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1216 is therefore inhibition of ADAMTS5, a GAM1216 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1216 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 has been established by previous studies. Proteolysis of the extracellular matrix plays a critical role in establishing tissue architecture during development and in tissue degradation in diseases such as cancer, arthritis, Alzheimer disease, and a variety of inflammatory conditions. The proteolytic enzymes responsible include members of diverse protease families and they may work in concert or in cascades to degrade or process molecules. Two groups of zinc metalloproteinases in particular, ADAMs and MMPs (e.g. 600754), appear broadly relevant to extracellular proteolysis. Most ADAM family members are quite similar in domain organization, bearing, from amino to carboxyl termini, a signal peptide, a proregion, a zinc metalloprotease catalytic domain with the typical reprolysin signature motif, a disintegrin domain, a cysteine- rich domain, an EGF- like domain, and, in many cases, a membrane- spanning region and a cytoplasmic domain with signaling potential. Members of the ADAMTS family differ substantially from the prototypic ADAM structure in that they lack the EGF- like domain, do not have a canonical disintegrin sequence, and possess modules with similar thrombospondin type 1 repeats. By searching an EST database using the protein sequences of human ADAMTS1 to ADAMTS4 and a C. elegans ADAMTS as queries, Hurskainen et al. (1999) identified ADAMTS5, ADAMTS6 (OMIM Ref. No. 605008), and ADAMTS7 (OMIM Ref. No. 605009). They determined a partial human ADAMTS5 cDNA sequence that lacked 5- prime coding sequence. The predicted partial ADAMTS5 protein has the domain structure

characteristic of ADAMTSs, beginning with a partial metalloproteinase domain. Northern blot analysis of several human tissues detected an approximately 10- kb ADAMTS5 transcript that was expressed at a low level in placenta and at barely detectable levels in a number of other tissues. Northern blot analysis showed that mouse Adamts5 was specifically expressed in a 7- day mouse embryo, and at low or undetectable levels thereafter. In situ hybridization of an 8.5- day mouse embryo showed uniform Adamts5 expression throughout the embryo. In addition, Adamts5 expression was found in trophoblastic cells lining the uterine cavity, in the developing placenta, and in the decidual reaction within the uterus. In a 10.5- day mouse embryo, Adamts5 expression was widespread, but at a lower level than in the 8.5- day embryo. Expression was found in mesenchyme and somites, as well as in the neural tube and developing hindgut. Abbaszade et al. (1999) demonstrated that recombinant ADAMTS5 expressed in insect cells cleaves aggrecan at the glu373- ala374 site, with the cleavage pattern and inhibitor profile indistinguishable from that observed with native aggrecanase. Northern blot analysis of several human tissues showed highest ADAMTS5 expression in placenta, with much lower expression in heart and brain. Major transcripts of 12.4, 10.7, 8.6, and 6.6 kb were detected. Real time PCR of a number of normal human tissues detected ADAMTS5 expression in placenta, cervix, uterus, bladder, and esophagus. Expression was also found in rib cartilage, chondroblastoma, and fibrous tissue and joint capsule samples from an arthritic patient.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Abbaszade, I.; Liu, R.- Q.; Yang, F.; Rosenfeld, S. A.; Ross, O. H.; Link, J. R.; Ellis, D. M.; Tortorella, M. D.; Pratta, M. A.; Hollis, J. M.; Wynn, R.; Duke, J. L.; and 15 others : Cloning and characterization of ADAMTS11, an aggrecanase from the ADAMTS family. J. Biol. Chem. 274: 23443- 23450, 1999. ; and

Hurskainen, T. L.; Hirohata, S.; Seldin, M. F.; Apte, S. S. : ADAM- TS5, ADAM- TS6, and ADAM- TS7, novel members of a new family of zinc metalloproteases: general features and genomic dis.

Further studies establishing the function and utilities of ADAMTS5 are found in John Hopkins OMIM database record ID 605007, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1216 APBA2 TACAGGCAGGCACAG Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A

AGGCAGT 2 (X11- l (APBA2, Accession NM_005503.2) is another GAM1216 target gene. APBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1216 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1216 is therefore inhibition of APBA2, a GAM1216 target gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1216 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA2.The function of APBA2 has been established by previous studies. The cytoplasmic domain of the Alzheimer disease locus amyloid protein precursor (APP; 104760) binds to 4 human phosphotyrosine- binding (PTB) proteins; see APBA1 (OMIM Ref. No. 602414). By use of a yeast 2- hybrid screening of a human brain cDNA library, McLoughlin and Miller (1996) identified 3 of these proteins: the human homolog of rat Fe65 (APBB1; 602709), an Fe65- like sequence (APBB2; 602710), and an X11- like sequence (APBA2). The human X11- like sequence is 83% identical to that encoded by the X11 gene (APBA1; 602414). McLoughlin and Miller (1996) detected a phosphotyrosine- binding domain in the protein encoded by the X11- like clone. Using a radiation hybrid panel, Blanco et al. (1998) mapped the APBA2 gene to human chromosome 15, between markers WI- 5590 (10.31 cR) and D15S144 (21.7 cR). In an interspecific backcross, using an SSCP- demonstrated polymorphism, they assigned the Apba2 gene to mouse chromosome 7. The location of the flanking markers suggested that Apba2 is a further addition to a gene segment conserved between mouse chromosome 7 and human 15q.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Blanco, G.; Irving, N. G.; Brown, S. D. M.; Miller, C. C. J.; McLoughlin, D. M. : Mapping of the human and murine X11- like genes (APBA2 and Apba2), the murine Fe65 gene (Apbb1), and the human Fe65-like gene (APBB2): genes encoding phosphotyrosine- binding domain proteins that interact with the Alzheimer's disease amyloid precursor protein. Mammalian Genome 9: 473- 475, 1998. ; and

McLoughlin, D. M.; Miller, C. C. J. : The intracellular cytoplasmic domain of the Alzheimer's disease amyloid precursor protein interacts with phosphotyrosine- binding domain proteins in.

Further studies establishing the function and utilities of APBA2 are found in John Hopkins OMIM database record ID 602712, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1216 DLST TACAGGCAGGCACAG Dihydrolipoamide S- succinyltransferase (E2 component of 2- A A
AGGCAGT oxo- glutarat (DLST, Accession NM_001933.2) is another GAM1216 target gene. DLST BINDING SITE1 and DLST BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DLST, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE1 and DLST BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1216 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1216 is therefore inhibition of DLST, a GAM1216 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1216 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM1216 NGB TACAGGCAGGCACAG Neuroglobin (NGB, Accession NM_021257.2) is another GAM1216 A A
AGGCAGT target gene. NGB BINDING SITE1 and NGB BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NGB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE1 and NGB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1216 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1216 is therefore inhibition of NGB, a GAM1216 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1216 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM1216 SNCG TACAGGCAGGCACAG SYNUCLEIN, GAMMA (SNCG, Accession NM_003087.1) is another A A
AGGCAGT GAM1216 target gene. SNCG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SNCG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCG BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1216 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1216 is therefore inhibition of

SNCG, a GAM1216 target gene which plays a role in neurofilament network integrity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1216 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCG.The function of SNCG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM1216 TFCP2 TACAGGCAGGCACAG Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is A A
AGGCAGT another GAM1216 target gene. TFCP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TFCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1216 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1216 is therefore inhibition of TFCP2, a GAM1216 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1216 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM760.

GAM1216 TGFB1 TACAGGCAGGCACAG TGFB1 (Accession NM_000660.1) is another GAM1216 target gene. A A
AGGCAGT TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1216 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1216 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1216 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1217 APPBP2 TATTACATTCATTTT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
GATGGTT Protein 2 (APPBP2, Accession NM_006380.2) is a GAM1217 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1217 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1217 is therefore inhibition of APPBP2, a GAM1217 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1217 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1217 IL1A TATTACATTCATTTT GATGGTT Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another GAM1217 target gene. IL1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1217 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1217 is therefore inhibition of IL1A, a GAM1217 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1217 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM1221 BACE TTCCAGATGGGTAGG AATACCT Beta- site APP- cleaving Enzyme (BACE, Accession NM_138971.1) is a GAM1221 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1221 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1221 is therefore inhibition of BACE, a GAM1221 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1221 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1234 BACE2 TGTCTTCATCCAGGA ACCACAT Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is a GAM1234 target gene. BACE2 BINDING SITE is a A A

target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1234 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1234 is therefore inhibition of BACE2, a GAM1234 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1234 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1234 DHCR24 TGTCTTCATCCAGGA 24- dehydrocholesterol Reductase (DHCR24, Accession A A
ACCACAT NM_014762.1) is another GAM1234 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1234 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1234 is therefore inhibition of DHCR24, a GAM1234 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1234 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1234 IAPP GCTGTGGTTCTGCAT Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is B A
GAAGACA another GAM1234 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1234 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1234 is therefore inhibition of IAPP, a GAM1234 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM1234 include diagnosis, prevention and treatment of Alzheimer, and of

other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1234 MME GCTGTGGTTCTGCAT GAAGACA Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_007288.1) is another GAM1234 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1234 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM1234 is therefore inhibition of MME, a GAM1234 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1234 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1238 CTSB TGCACCACTGCACTC CAGCCTG CTSB (Accession NM_147782.1) is a GAM1238 target gene. CTSB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CTSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1238 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1238 is therefore inhibition of CTSB. Accordingly, utilities of GAM1238 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM1238 FHL2 TGCACCACTGCACTC CAGCCTG Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is another GAM1238 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1238 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1238 is therefore inhibition of FHL2, a GAM1238 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer.

Accordingly, utilities of GAM1238 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1238 IGF1 TGCACCACTGCACTC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
CAGCCTG NM_000618.2) is another GAM1238 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1238 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1238 is therefore inhibition of IGF1, a GAM1238 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1238 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1238 PRND TGCACCACTGCACTC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A
CAGCCTG another GAM1238 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1238 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1238 is therefore inhibition of PRND, a GAM1238 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1238 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1293 ADAMTS5 GCTGTGTTAACTGTT A Disintegrin- like and Metalloprotease (reprolysin type) with A A
CAAACTC Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM1293 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING

SITE, and secondary structure complementarity to the nucleotide sequence of GAM1293 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1293 is therefore inhibition of ADAMTS5, a GAM1293 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1293 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM1293 APPBP2 GCTGTGTTAACTGTT CAAACTC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is another GAM1293 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1293 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1293 is therefore inhibition of APPBP2, a GAM1293 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1293 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1293 DHCR24 GCTGTGTTAACTGTT CAAACTC 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is another GAM1293 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1293 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1293 is therefore inhibition of DHCR24, a GAM1293 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1293 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to GAM44.

GAM1293 PRNP GCTGTGTTAACTGTT CAAACTC Prion Protein (p27- 30) (Creutzfeld- Jakob disease, Gerstmann- Strausler- (PRNP, Accession NM_000311.1) is another GAM1293 target gene. PRNP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRNP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRNP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1293 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1293 is therefore inhibition of PRNP, a GAM1293 target gene which the function of prp is not known. prp is encoded in the host genome and is expressed both in normal and infected cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1293 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRNP.The function of PRNP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM1294 DHCR24 TGGATTAGTAAAGAA GAATGAA 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is a GAM1294 target gene. DHCR24 BINDING SITE1 and DHCR24 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DHCR24, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE1 and DHCR24 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1294 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1294 is therefore inhibition of DHCR24, a GAM1294 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1294 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1294 DLST TGGATTAGTAAAGAA GAATGAA Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM1294 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1294 RNA are set forth in Tables 6 and 7, hereby A A

incorporated herein.

Another function of GAM1294 is therefore inhibition of DLST, a GAM1294 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1294 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM1294 PSEN1 TGGATTAGTAAAGAA PSEN1 (Accession NM_007318.1) is another GAM1294 target gene. A A

GAATGAA PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1294 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1294 is therefore inhibition of PSEN1. Accordingly, utilities of GAM1294 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM1294 SLC6A4 TGGATTAGTAAAGAA Solute Carrier Family 6 (neurotransmitter transporter, A A
GAATGAA serotonin), Mem (SLC6A4, Accession NM_001045.1) is another GAM1294 target gene. SLC6A4 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SLC6A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC6A4 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1294 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1294 is therefore inhibition of SLC6A4, a GAM1294 target gene which terminates the action of serotonine by its high affinity sodium- dependent reuptake into presynaptic terminals. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1294 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC6A4.The function of SLC6A4 has been established by previous studies. Altered function of the serotonin neurotransmission system has been implicated in the aggressive behavior in patients with Alzheimer disease (AD; 104300). Sukonick et al. (2001) studied 137 subjects diagnosed as having possible or probable AD, 58 of whom demonstrated aggressive behavior. They found that the *L/*L genotype was significantly associated with aggression in patients with AD (odds ratio, 2.8). Similar results were obtained for *L allele frequency. Hariri et al. (2002) reported that

individuals with 1 or 2 copies of the short allele of the serotonin transporter promoter polymorphism, which has been associated with reduced serotonin expression and function and increased fear and anxiety- related behaviors, exhibited greater amygdala neuronal activity, as assessed by functional MRI, in response to fearful stimuli compared with individuals homozygous for the long allele. Each group consisted of 14 adults. Hariri et al. (2002) concluded that their results demonstrated genetically driven variation in the response of brain regions underlying human emotional behavior and suggested that differential excitability of the amygdala to emotional stimuli may contribute to the increased fear and anxiety typically associated with the short SLC6A4 allele

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Hariri, A. R.; Mattay, V. S.; Tessitore, A.; Kolachana, B.; Fera, F.; Goldman, D.; Egan, M. F.; Weinberger, D. R. : Serotonin transporter genetic variation and the response of the human amygdala. Science 297: 400- 403, 2002. ; and

Sukonick, D. L.; Pollock, B. G.; Sweet, R. A.; Mulsant, B. H.; Rosen, J.; Klunk, W. E.; Kastango, K. B.; DeKosky, S. T.; Ferrell, R. E. : The 5- HTTPR*S/*L polymorphism and aggressive behav.

Further studies establishing the function and utilities of SLC6A4 are found in John Hopkins OMIM database record ID 182138, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1295 BACE2 GAGAGAGGTAGAGGG GAGCAGA Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is a GAM1295 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1295 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1295 is therefore inhibition of BACE2, a GAM1295 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1295 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1295 DLST GAGAGAGGTAGAGGG Dihydrolipoamide S- succinyltransferase (E2 component of 2- A A

GAGCAGA oxo- glutarat (DLST, Accession NM_001933.2) is another GAM1295 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1295 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1295 is therefore inhibition of DLST, a GAM1295 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1295 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM1295 GFAP GAGAGAGGTAGAGGG GFAP (Accession NM_002055.2) is another GAM1295 target gene. A A

GAGCAGA GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1295 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1295 is therefore inhibition of GFAP. Accordingly, utilities of GAM1295 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM1300 ADAM10 TGCTAGGCTTATTCT A Disintegrin and Metalloproteinase Domain 10 (ADAM10, A A

CTTCCTC Accession NM_001110.1) is a GAM1300 target gene. ADAM10 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1300 is therefore inhibition of ADAM10, a GAM1300 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM10.The function of ADAM10 has been established by previous studies. Wolfsberg et al. (1995) identified a family of proteins containing a disintegrin and metalloproteinase

(ADAM) domain. Members of this family are cell surface proteins with a unique structure possessing both potential adhesion and protease domains. Tumor necrosis factor- alpha (TNFA; 191160) is synthesized as a proinflammatory cytokine from a 233- amino acid precursor. Conversion of the membrane- bound precursor to a secreted mature protein is mediated by a protease termed TNFA convertase. Lunn et al. (1997) found that ADAM10 possesses TNFA convertase activity. TNFA is involved in a variety of diseases. To elucidate whether the ADAM10 locus maps to the same region as a disease susceptibility, Yamazaki et al. (1997) mapped the ADAM10 locus. Using a radiation hybrid mapping method, they showed that ADAM10 is located on 15q21.3- q23. Although ephrins form a high- affinity multivalent complex with their receptors present on axons, axons can be rapidly repelled rather than being bound. Hattori et al. (2000) showed that ephrin- A2 (OMIM Ref. No. 602756) forms a stable complex with the metalloproteinase Kuzbanian (OMIM Ref. No. ADAM10) involving interactions outside the cleavage region and the protease domain. Eph receptor binding triggered ephrin- A2 cleavage in a localized reaction specific to the cognate ligand. The cleavage- inhibiting mutation in ephrin- A2 delayed axon withdrawal. Hattori et al. (2000) concluded that their studies reveal mechanisms for protease recognition and control of cell surface proteins, and, for ephrin-A2, they may provide a means for efficient axon detachment and termination of signaling.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Lunn, C. A.; Fan, X.; Dalie, B.; Miller, K.; Zavodny, P. J.; Narula, S. K.; Lundell, D. : Purification of ADAM 10 from bovine spleen as a TNFalpha convertase. FEBS Lett. 400: 333- 335, 1997. ; and

Hattori, M.; Osterfield, M.; Flanagan, J. G. : Regulated cleavage of a contact- mediated axon repellent. Science 289: 1360-1365, 2000.

Further studies establishing the function and utilities of ADAM10 are found in John Hopkins OMIM database record ID 602192, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1300 CHAT TGCTAGGCTTATTCT A A CTTCCTC Choline Acetyltransferase (CHAT, Accession NM_020985.1) is another GAM1300 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1300 is therefore inhibition of CHAT, a GAM1300 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1300 A A NGB CTTCCTC TGCTAGGCTTATTCT Neuroglobin (NGB, Accession NM_021257.2) is another GAM1300 target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1300 is therefore inhibition of NGB, a GAM1300 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM1300 A A PSEN1 CTTCCTC TGCTAGGCTTATTCT PSEN1 (Accession NM_000021.2) is another GAM1300 target gene. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1300 is therefore inhibition of PSEN1. Accordingly, utilities of GAM1300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM1300 A A S100B CTTCCTC TGCTAGGCTTATTCT S100 Calcium- binding Protein, Beta (neural) (S100B, Accession NM_006272.1) is another GAM1300 target gene. S100B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of S100B BINDING SITE, and secondary structure

complementarity to the nucleotide sequence of GAM1300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1300 is therefore inhibition of S100B, a GAM1300 target gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with S100B.The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.

GAM1300 SNCAIP TGCTAGGCTTATTCT CTTCCTC Synuclein, Alpha Interacting Protein (synphilin) (SNCAIP, Accession NM_005460.1) is another GAM1300 target gene. SNCAIP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCAIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCAIP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1300 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1300 is therefore inhibition of SNCAIP, a GAM1300 target gene which promotes formation of cytosolic inclusions in neurons. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCAIP.The function of SNCAIP has been established by previous studies. Parkinson disease (PD) is a neurodegenerative disease characterized by tremor, bradykinesia, rigidity, and postural instability. Postmortem examination shows loss of neurons and Lewy bodies, which are cytoplasmic eosinophilic inclusions, in the substantia nigra and other brain regions. A few families have been found to have PD on the basis of mutations, A53T (163890.0001) or A30P (163890.0002), in the gene encoding alpha-synuclein (SNCA). Alpha- synuclein is present in Lewy bodies of patients with sporadic PD, suggesting that alpha- synuclein may be involved in the pathogenesis of PD. To determine the protein-interaction partners of alpha- synuclein, Engelender et al. (1999) screened human brain libraries in the yeast 2- hybrid system. They identified a novel interacting protein they designated synphilin- 1, encoded by the gene SNCAIP. The predicted 919- amino acid synphilin-1 protein contains several protein- protein interaction domains, such as ankyrin- like repeats and a coiled- coil domain. An approximately 4- kb SNCAIP transcript was detected in many human tissues by Northern blot analysis and was particularly enriched in brain, heart, and placenta. Synphilin- 1 was present in many regions in brain, including substantia nigra. In immunoblot analyses of human brain, synphilin- 1 appeared as a single band of approximately 90 kD in several brain regions, with no differences in the level of

expression in controls, patients with PD, or patients with Alzheimer disease (OMIM Ref. No. 104300). They found that alpha- synuclein interacts in vivo with synphilin- 1 in neurons. Cotransfection of both proteins (but not control proteins) in HEK293 cells yielded cytoplasmic eosinophilic inclusions. Engelender et al. (2000) determined that the human SNCAIP gene contains 10 exons and has a highly polymorphic GT repeat within intron 5 that is suitable for linkage analysis in families with Parkinson disease. Using immunohistochemistry in human postmortem brain tissue, they found that synphilin- 1 protein, like alpha- synuclein protein, is present in neuropil.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Engelender, S.; Kaminsky, Z.; Guo, X.; Sharp, A. H.; Amaravi, R. K.; Kleiderlein, J. J.; Margolis, R. L.; Troncoso, J. C.; Lanahan, A. A.; Worley, P. F.; Dawson, V. L.; Dawson, T. M.; Ross, C. A. : Synphilin- 1 associates with alpha- synuclein and promotes the formation of cytosolic inclusions. Nature Genet. 22: 110- 114, 1999. ; and

Engelender, S.; Wanner, T.; Kleiderlein, J. J.; Wakabayashi, K.; Tsuji, S.; Takahashi, H.; Ashworth, R.; Margolis, R. L.; Ross, C. A. : Organization of the human synphilin- 1 gene, a ca.

Further studies establishing the function and utilities of SNCAIP are found in John Hopkins OMIM database record ID 603779, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1310 AVP CACTGCAACCCCCGC AVP (Accession NM_000490.2) is a GAM1310 target gene. AVP A A
CTCCCAG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1310 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1310 is therefore inhibition of AVP. Accordingly, utilities of GAM1310 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM1310 IAPP CACTGCAACCCCCGC Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is A A
CTCCCAG another GAM1310 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the

nucleotide sequence of GAM1310 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1310 is therefore inhibition of IAPP, a GAM1310 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM1310 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1310 NGB CACTGCAACCCCCGC Neuroglobin (NGB, Accession NM_021257.2) is another GAM1310 A A
CTCCCAG target gene. NGB BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1310 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1310 is therefore inhibition of NGB, a GAM1310 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1310 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM1310 TFCP2 CACTGCAACCCCCGC Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is A A
CTCCCAG another GAM1310 target gene. TFCP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TFCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1310 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1310 is therefore inhibition of TFCP2, a GAM1310 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1310 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM760.

GAM1332 DSCR1 TGAGGTAGGTGCTGA Down Syndrome Critical Region Gene 1 (DSCR1, Accession
A A
AACTGC NM_004414.3) is a GAM1332 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1332 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1332 is therefore inhibition of DSCR1, a GAM1332 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1332 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 has been established by previous studies. The study of patients with partial trisomy 21 has defined an area of approximately 3 Mb at chromosomal region 21q22 as the minimal candidate region for the Down syndrome phenotype (OMIM Ref. No. 190685). Using a novel exon cloning strategy, Fuentes et al. (1995) identified several putative exons from region 21q22.1- q22.2. One exon was used to isolate fetal brain cDNAs corresponding to a gene that the authors designated DSCR1. The predicted 171- amino acid protein contains 2 proline-rich regions, a putative DNA- binding domain, and an acidic region. Northern blot analysis revealed that the 2.2- kb DSCR1 transcript is expressed at the highest levels in fetal brain and adult heart and at lower levels in various other tissues. An additional 2- kb mRNA was detected in fetal and adult liver. Increased expression in the brains of young rats compared with adults suggested to Fuentes et al. (1995) that DSCR1 plays a role during central nervous system development. Fuentes et al. (1997) determined that DSCR1 spans nearly 45 kb and contains 7 exons, 4 of which are alternative first exons. They found tissue- specific expression patterns for the alternative transcripts. Kingsbury and Cunningham (2000) referred to the proteins encoded by the MCIP genes as calcipressins. Functional analysis showed that when expressed in yeast, DSCR1 and ZAKI4 inhibited calcineurin function. The authors proposed that increased expression of DSCR1 in trisomy- 21 individuals may contribute to the neurologic, cardiac, or immunologic defects of Down syndrome.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Fuentes, J. J.; Pritchard, M. A.; Estivill, X. : Genomic organization, alternative splicing, and expression patterns of the DSCR1 (Down syndrome candidate region 1) gene. Genomics 44: 358-361, 1997. ; and

Kingsbury, T. J.; Cunningham, K. W. : A conserved family of calcineurin regulators. Genes Dev. 14: 1595- 1604, 2000.

Further studies establishing the function and utilities of DSCR1 are found in John Hopkins OMIM database record ID 602917, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1332 FLNB TGAGGTAGGTGCTGA AACTGC Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is another GAM1332 target gene. FLNB BINDING SITE1 and FLNB BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLNB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE1 and FLNB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1332 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1332 is therefore inhibition of FLNB, a GAM1332 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1332 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM1332 IAPP TGAGGTAGGTGCTGA AACTGC Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM1332 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1332 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1332 is therefore inhibition of IAPP, a GAM1332 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM1332 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1332 IGF1 TGAGGTAGGTGCTGA AACTGC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM1332 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. A A

Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1332 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1332 is therefore inhibition of IGF1, a GAM1332 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1332 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1338 APPBP2 ACTGCACTCCAGCCT GGGCAAC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM1338 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1338 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1338 is therefore inhibition of APPBP2, a GAM1338 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1338 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1338 BACE2 ACTGCACTCCAGCCT GGGCAAC Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_012105.3) is another GAM1338 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1338 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1338 is therefore inhibition of BACE2, a GAM1338 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1338 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1338 FHL2 ACTGCACTCCAGCCT Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

GGGCAAC another GAM1338 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1338 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1338 is therefore inhibition of FHL2, a GAM1338 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1338 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1338 IGF1 ACTGCACTCCAGCCT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

GGGCAAC NM_000618.2) is another GAM1338 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1338 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1338 is therefore inhibition of IGF1, a GAM1338 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1338 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1338 MME ACTGCACTCCAGCCT Membrane Metallo- endopeptidase (neutral endopeptidase, A A

GGGCAAC enkephalinase, (MME, Accession NM_000902.2) is another GAM1338 target gene. MME BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1338 RNA are set forth in Tables 6 and 7,

hereby incorporated herein.

Another function of GAM1338 is therefore inhibition of MME, a GAM1338 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1338 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1338 PRND ACTGCACTCCAGCCT GGGCAAC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM1338 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM1338 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1338 is therefore inhibition of PRND, a GAM1338 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1338 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1361 APLP2 AGAAGTAGTAGTAGC AGTAGTA Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession NM_001642.1) is a GAM1361 target gene. APLP2 BINDING SITE1 and APLP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APLP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE1 and APLP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1361 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1361 is therefore inhibition of APLP2, a GAM1361 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1361 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM1361 HTR2A AGAAGTAGTAGTAGC 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession A A

AGTAGTA NM_000621.1) is another GAM1361 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1361 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1361 is therefore inhibition of HTR2A, a GAM1361 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1361 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM1363 DSCR1 AGCTGGTGTGTAGCG Down Syndrome Critical Region Gene 1 (DSCR1, Accession A A

GGTACCT NM_004414.3) is a GAM1363 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1363 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1363 is therefore inhibition of DSCR1, a GAM1363 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1363 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM1363 PRNP AGCTGGTGTGTAGCG Prion Protein (p27- 30) (Creutzfeld- Jakob disease, Gerstmann- A A

GGTACCT Strausler- (PRNP, Accession NM_000311.1) is another GAM1363 target gene. PRNP BINDING SITE1 and PRNP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRNP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRNP BINDING SITE1 and PRNP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1363 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1363 is therefore inhibition of PRNP, a GAM1363 target gene which the function of prp is not known. prp is encoded in the host genome and is expressed both in normal

and infected cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1363 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRNP.The function of PRNP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM1372 FHL2 CACTGCACTCCAACC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

TGGACAA a GAM1372 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1372 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1372 is therefore inhibition of FHL2, a GAM1372 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1372 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1372 IGF1 CACTGCACTCCAACC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

TGGACAA NM_000618.2) is another GAM1372 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1372 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1372 is therefore inhibition of IGF1, a GAM1372 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1372 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1372 PRND CACTGCACTCCAACC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

TGGACAA another GAM1372 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1372 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1372 is therefore inhibition of PRND, a GAM1372 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1372 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1423 HD GTCAGCAAGGAGGGG HD (Accession NM_002111.3) is a GAM1423 target gene. HD BINDING A A
TGGACAA SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1423 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1423 is therefore inhibition of HD. Accordingly, utilities of GAM1423 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM1431 IGF1 CTGGGATGGAGGAGA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
ATTAGAG NM_000618.2) is a GAM1431 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1431 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1431 is therefore inhibition of IGF1, a GAM1431 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1431 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1440 BACE TCCAGTGAAACAGGT Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A
CTCTTTG is a GAM1440 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1440 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1440 is therefore inhibition of BACE, a GAM1440 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1440 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1440 TNFRSF5 TCCAGTGAAACAGGT TNFRSF5 (Accession NM_152854.1) is another GAM1440 target gene. A A

CTCTTTG TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1440 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1440 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM1440 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM1443 ADAMTS5 GGCATGTGTGAGCAG A Disintegrin- like and Metalloprotease (reprolysin type) with A A

CTGCAGG Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM1443 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1443 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1443 is therefore inhibition of ADAMTS5, a GAM1443 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1443 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM1443 APLP2 GGCATGTGTGAGCAG Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession A A

CTGCAGG NM_001642.1) is another GAM1443 target gene. APLP2 BINDING SITE1 and APLP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APLP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE1 and APLP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1443 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1443 is therefore inhibition of APLP2, a GAM1443 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1443 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM1443 APPBP2 GGCATGTGTGAGCAG Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
CTGCAGG Protein 2 (APPBP2, Accession NM_006380.2) is another GAM1443 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1443 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1443 is therefore inhibition of APPBP2, a GAM1443 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1443 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1443 CNTF GGCATGTGTGAGCAG Ciliary Neurotrophic Factor (CNTF, Accession NM_000614.2) is A A
CTGCAGG another GAM1443 target gene. CNTF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNTF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CNTF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1443 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1443 is therefore inhibition of CNTF, a GAM1443 target gene which is a survival factor for various neuronal cell types. and therefore is associated with Alzheimer.

Accordingly, utilities of GAM1443 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CNTF.The function of CNTF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM175.

GAM1443 HD GGCATGTGTGAGCAG HD (Accession NM_002111.3) is another GAM1443 target gene. HD A A

CTGCAGG BINDING SITE1 through HD BINDING SITE4 are target binding sites found in untranslated regions of mRNA encoded by HD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE1 through HD BINDING SITE4, and secondary structure complementarity to the nucleotide sequence of GAM1443 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1443 is therefore inhibition of HD. Accordingly, utilities of GAM1443 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM1443 MAPK10 GGCATGTGTGAGCAG Mitogen- activated Protein Kinase 10 (MAPK10, Accession A A

CTGCAGG NM_138981.1) is another GAM1443 target gene. MAPK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1443 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1443 is therefore inhibition of MAPK10, a GAM1443 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1443 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM1443 TRPM2 GGCATGTGTGAGCAG TRPM2 (Accession NM_003307.1) is another GAM1443 target gene. A A

CTGCAGG TRPM2 BINDING SITE1 and TRPM2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TRPM2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE1 and TRPM2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1443 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1443 is therefore inhibition of TRPM2, a GAM1443 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM1443 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1447 PRND TGCTGTGCTAAAGGA AGGATTA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is a GAM1447 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1447 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1447 is therefore inhibition of PRND, a GAM1447 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1447 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1456 BACE2 ATACTGAGAGAAAAA GCTTGTC Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is a GAM1456 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1456 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1456 is therefore inhibition of BACE2, a GAM1456 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1456 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1456 IGF1 ATACTGAGAGAAAAA GCTTGTC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM1456 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as A A

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1456 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1456 is therefore inhibition of IGF1, a GAM1456 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1456 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1461 BACE2 TGGGCTCGCTCTTCA GTCTCGG Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is a GAM1461 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1461 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1461 is therefore inhibition of BACE2, a GAM1461 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1461 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1469 APBB2 TTCTATGATTCTCTA AGTAGCA Amyloid Beta (A4) Precursor Protein- binding, Family B, Member 2 (Fe65- (APBB2, Accession NM_173075.1) is a GAM1469 target gene. APBB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1469 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1469 is therefore inhibition of APBB2, a GAM1469 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1469 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical

conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1469 OLR1 TTCTATGATTCTCTA AGTAGCA Oxidised Low Density Lipoprotein (lectin- like) Receptor 1 (OLR1, Accession NM_002543.1) is another GAM1469 target gene. OLR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OLR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OLR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1469 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1469 is therefore inhibition of OLR1, a GAM1469 target gene which is involved in degradation of oxidized LDL by vascular endothelial cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1469 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OLR1.The function of OLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1469 BACE2 TCTGCTTGGACTGAT CATTGAA Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is another GAM1469 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1469 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM1469 is therefore inhibition of BACE2, a GAM1469 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1469 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1469 GFAP TCTGCTTGGACTGAT CATTGAA GFAP (Accession NM_002055.2) is another GAM1469 target gene. GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1469 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM1469 is therefore inhibition of GFAP. Accordingly, utilities of GAM1469 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM1469 MAPT TCTGCTTGGACTGAT CATTGAA Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM1469 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1469 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM1469 is therefore inhibition of MAPT, a GAM1469 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1469 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM1479 GYPA GAAGGCAGTAGGTTG TATAGTT Glycophorin A (includes MN blood group) (GYPA, Accession NM_002099.2) is a GAM1479 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1479 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1479 is therefore inhibition of GYPA, a GAM1479 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1479 IGF1 GAAGGCAGTAGGTTG TATAGTT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM1479 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1479 RNA are set A A

forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1479 is therefore inhibition of IGF1, a GAM1479 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1484 IGF1 ATATTGGTGAAATGC TAGCAAA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is a GAM1484 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1484 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1484 is therefore inhibition of IGF1, a GAM1484 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1484 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1484 SOD2 ATATTGGTGAAATGC TAGCAAA Superoxide Dismutase 2, Mitochondrial (SOD2, Accession NM_000636.1) is another GAM1484 target gene. SOD2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SOD2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SOD2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1484 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1484 is therefore inhibition of SOD2, a GAM1484 target gene which is intramitochondrial free radical scavenging enzyme. When he has polymorphism in signal peptides he could couse diseases of distribution and therefore is associated with Alzheimer. Accordingly, utilities of GAM1484 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SOD2.The function of SOD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1197.

GAM1484 ACT TTTGCAGTGTTCATC Activator of CAMP- responsive Element Modulator (CR (ACT, B A

AGTATTT Accession NM_020482.3) is another GAM1484 target gene. ACT BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ACT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1484 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1484 is therefore inhibition of ACT, a GAM1484 target gene which a plasma protease inhibitor synthesized in the liver. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1484 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACT.The function of ACT has been established by previous studies. Alpha- 1- antichymotrypsin is a plasma protease inhibitor synthesized in the liver. It is a single glycopeptide chain of about 68,000 daltons and belongs to the class of serine protease inhibitors. In man, the normal serum level is about one- tenth that of alpha- 1- antitrypsin (PI; 107400), with which it shares nucleic acid and protein sequence homology (Chandra et al. 1983). Both are major acute phase reactants; their concentrations in plasma increase in response to trauma, surgery, and infection. Antithrombin III, which also is structurally similar to alpha- 1- antitrypsin, shows less sequence homology to antichymotrypsin and is not an acute phase reactant. Sefton et al. (1990) concluded that the PI- PIL gene cluster is only 220 kb away from the AACT gene and that it is oriented in the opposite direction. (PIL refers to 'PI- like' and is also referred to as 'antitrypsin- related,' or ATR (OMIM Ref. No. 107410).) The comparatively short interval between the genes came as a surprise given previous estimates of the level of genetic recombination between them. By PCR- single strand conformation polymorphism (SSCP) analysis, Tsuda et al. (1992) identified a point mutation in exon 5 of the AACT gene resulting in substitution of met by val at codon 389. The mutation, an A- to- G transition at basepair 1252, was found in heterozygous state in 6 patients; 4 of the 6 (aged 38, 43, 69, and 80 years) had occlusive cerebrovascular disease.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Chandra, T.; Stackhouse, R.; Kidd, V. J.; Robson, K. J. H.; Woo, S. L. C. : Sequence homology between human alpha- 1- antichymotrypsin, alpha- 1- antitrypsin, and antithrombin III. Biochemistry 22: 5055- 5061, 1983. ; and

Tsuda, M.; Sei, Y.; Yamamura, M.; Yamamoto, M.; Shinohara, Y. : Detection of a new mutant alpha- 1- antichymotrypsin in patients with occlusive- cerebrovascular disease. FEBS Lett. 304: 66.

Further studies establishing the function and utilities of ACT are found in John Hopkins OMIM database record ID 107280, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1484 ADAMTS5 TTTGCAGTGTTCATC A Disintegrin- like and Metalloprotease (reprolysin type) with B A
AGTATTT Thrombos (ADAMTS5, Accession NM_007038.1) is another GAM1484 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1484 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1484 is therefore inhibition of ADAMTS5, a GAM1484 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1484 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM1484 NCKAP1 TTTGCAGTGTTCATC NCKAP1 (Accession NM_013436.2) is another GAM1484 target gene. B A
AGTATTT NCKAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1484 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1484 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM1484 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM1490 ACHE GTGTGTGGAAATGCA Acetylcholinesterase (YT blood group) (ACHE, Accession A A
GATGACC NM_015831.1) is a GAM1490 target gene. ACHE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACHE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACHE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1490 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1490 is therefore inhibition of ACHE, a GAM1490 target gene which rapidly hydrolyzes choline released into

the synapse. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1490 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACHE.The function of ACHE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1191.

GAM1490 MAPT GTGTGTGGAAATGCA GATGACC Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM1490 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1490 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1490 is therefore inhibition of MAPT, a GAM1490 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1490 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM1500 ACE GGCAGTGTCATTAGC TGATTGT Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_000789.2) is a GAM1500 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1500 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1500 is therefore inhibition of ACE, a GAM1500 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM1500 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1500 PSEN1 GGCAGTGTCATTAGC TGATTGT PSEN1 (Accession NM_007318.1) is another GAM1500 target gene. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE A A

I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1500 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1500 is therefore inhibition of PSEN1. Accordingly, utilities of GAM1500 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM1502 ACT TATATGTCTGGTATT CTTGGGG Activator of CAMP- responsive Element Modulator (CR (ACT, Accession NM_020482.3) is a GAM1502 target gene. ACT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1502 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1502 is therefore inhibition of ACT, a GAM1502 target gene which a plasma protease inhibitor synthesized in the liver. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1502 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACT.The function of ACT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1484.

GAM1502 MME TATATGTCTGGTATT CTTGGGG Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_000902.2) is another GAM1502 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1502 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1502 is therefore inhibition of MME, a GAM1502 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1502 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1523 MAPK10 GTTTGGCACTGAATC ATATACA Mitogen- activated Protein Kinase 10 (MAPK10, Accession NM_138980.1) is a GAM1523 target gene. MAPK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE A A

III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1523 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1523 is therefore inhibition of MAPK10, a GAM1523 target gene which is a members of the mitogen- activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1523 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM1523 RAGE GTTTGGCACTGAATC Renal Tumor Antigen (RAGE, Accession NM_014226.1) is another A A

ATATACA GAM1523 target gene. RAGE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAGE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of RAGE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1523 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1523 is therefore inhibition of RAGE, a GAM1523 target gene which is essential for the completion of the start, the controlling event, in the cell cycle and therefore is associated with Alzheimer. Accordingly, utilities of GAM1523 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with RAGE.The function of RAGE has been established by previous studies. Sugaya et al. (1994) identified 3 genes located 90 to 140 kb centromeric to the tenascin- like gene (OMIM Ref. No. 600261) in the MHC class III region near the junction with class II. One of these was the gene for receptor of advanced glycosylation end products of proteins, a member of the immunoglobulin superfamily. A second was the PBX2 homeo box gene (OMIM Ref. No. 176311), and a third was the human counterpart of the mouse mammary tumor gene int- 3 (OMIM Ref. No. 164951). The PBX2 and AGER genes are immediately contiguous and are transcribed in the same direction. In addition to mapping by contiguous cosmids and YAC clones, Sugaya et al. (1994) determined the location of the AGER sequence on 6p21.3 by fluorescence in situ hybridization. Yan et al. (1996) reported that the AGER protein, called RAGE (receptor for advanced glycation end products) by them, is an important receptor for the amyloid beta peptide (OMIM Ref. No. 104760) and that expression of this receptor increases in Alzheimer disease (OMIM Ref. No. 104300). They noted that expression of RAGE is particularly increased in neurons close to deposits of amyloid beta peptide and to neurofibrillary tangles.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Sugaya, K.; Fukagawa, T.; Matsumoto, K.; Mita, K.; Takahashi, E.; Ando, A.; Inoko, H.; Ikemura, T. : Three genes in the human MHC class III region near the junction with the class II: gene for receptor of advanced glycosylation end products, PBX2 homeobox gene and a Notch homolog, human counterpart of mouse mammary tumor gene int- 3. Genomics 23: 408- 419, 1994. ; and

Yan, S. D.; Chen, X.; Fu, J.; Chen, M.; Zhu, H.; Roher, A.; Slattery, T.; Zhao, L.; Nagashima, M.; Morser, J.; Migheli, A.; Nawroth, P.; Stern, D.; Schmidt, A. M. : RAGE and amyloid- beta.

Further studies establishing the function and utilities of RAGE are found in John Hopkins OMIM database record ID 600214, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1543 APPBP2 ATTGCACTCCAGCCT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A GGGTGAC Protein 2 (APPBP2, Accession NM_006380.2) is a GAM1543 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1543 is therefore inhibition of APPBP2, a GAM1543 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1543 FHL2 ATTGCACTCCAGCCT Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A GGGTGAC another GAM1543 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1543 is therefore inhibition of FHL2, a GAM1543 target gene which Contains four LIM domains and an

additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1543 IGF1 ATTGCACTCCAGCCT GGGTGAC A A Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM1543 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1543 is therefore inhibition of IGF1, a GAM1543 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1543 PRND ATTGCACTCCAGCCT GGGTGAC A A Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM1543 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1543 is therefore inhibition of PRND, a GAM1543 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1543 TNFRSF5 ATTGCACTCCAGCCT GGGTGAC A A TNFRSF5 (Accession NM_152854.1) is another GAM1543 target gene. TNFRSF5 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide

sequences of TNFRSF5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1543 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM1543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM1550 ACE TGAGTATTCACCAGG TGCTGGG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM1550 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1550 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1550 is therefore inhibition of ACE, a GAM1550 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM1550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1550 ADAM17 TGAGTATTCACCAGG TGCTGGG A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, (ADAM17, Accession NM_021832.1) is another GAM1550 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1550 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1550 is therefore inhibition of ADAM17, a GAM1550 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1550 CAV1 TGAGTATTCACCAGG TGCTGGG Caveolin 1, Caveolae Protein, 22kD (CAV1, Accession NM_001753.3) is another GAM1550 target gene. CAV1 BINDING SITE1 and CAV1 BINDING SITE2 are target binding sites found in untranslated A A

regions of mRNA encoded by CAV1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV1 BINDING SITE1 and CAV1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1550 is therefore inhibition of CAV1, a GAM1550 target gene which may act as a scaffolding protein within caveolar membranes, and interacts directly with g- protein alpha subunits and can functionally regulate their activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV1.The function of CAV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1087.

GAM1550 GYPA TGAGTATTCACCAGG Glycophorin A (includes MN blood group) (GYPA, Accession A A

TGCTGGG NM_002099.2) is another GAM1550 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1550 is therefore inhibition of GYPA, a GAM1550 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1550 NOTCH1 TGAGTATTCACCAGG Notch (Drosophila) Homolog 1 (translocation- associated) A A

TGCTGGG (NOTCH1, Accession NM_017617.2) is another GAM1550 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1550 is therefore inhibition of NOTCH1, a GAM1550 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1550 include diagnosis,

prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM1550 PSEN2 TGAGTATTCACCAGG A A TGCTGGG PSEN2 (Accession NM_012486.1) is another GAM1550 target gene. PSEN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1550 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1550 is therefore inhibition of PSEN2. Accordingly, utilities of GAM1550 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN2.

GAM1602 APPBP2 GGAGTGTAAAGAAGG A A ATGTTAC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM1602 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1602 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1602 is therefore inhibition of APPBP2, a GAM1602 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1602 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1602 B2M GGAGTGTAAAGAAGG A A ATGTTAC Beta- 2- microglobulin (B2M, Accession NM_004048.1) is another GAM1602 target gene. B2M BINDING SITE1 and B2M BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by B2M, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of B2M BINDING SITE1 and B2M BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1602 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1602 is therefore inhibition of B2M, a GAM1602 target gene which is the beta- chain of major

histocompatibility complex class I molecules. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1602 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with B2M.The function of B2M and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM205.

GAM1602 MAPT GGAGTGTAAAGAAGG ATGTTAC A A Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM1602 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1602 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1602 is therefore inhibition of MAPT, a GAM1602 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1602 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM1607 BACE TTAATGCTAATCGTG A A ATAGGGG Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) is a GAM1607 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1607 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1607 is therefore inhibition of BACE, a GAM1607 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1607 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1607 FPRL1 TTAATGCTAATCGTG A A ATAGGGG FPRL1 (Accession NM_001462.1) is another GAM1607 target gene. FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1607 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1607 is therefore inhibition of FPRL1. Accordingly, utilities of GAM1607 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM1607 SLC6A4 TTAATGCTAATCGTG ATAGGGG Solute Carrier Family 6 (neurotransmitter transporter, serotonin), Mem (SLC6A4, Accession NM_001045.1) is another GAM1607 target gene. SLC6A4 BINDING SITE1 and SLC6A4 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SLC6A4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC6A4 BINDING SITE1 and SLC6A4 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1607 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1607 is therefore inhibition of SLC6A4, a GAM1607 target gene which terminates the action of serotonine by its high affinity sodium- dependent reuptake into presynaptic terminals. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1607 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC6A4.The function of SLC6A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1294.

GAM1617 ACE TTGCCCAGGCTGGAG TGCAGTG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM1617 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1617 is therefore inhibition of ACE, a GAM1617 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM1617 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1617 ADAM17 TTGCCCAGGCTGGAG A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A

TGCAGTG factor, (ADAM17, Accession NM_003183.3) is another GAM1617 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1617 is therefore inhibition of ADAM17, a GAM1617 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1617 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1617 CHAT TTGCCCAGGCTGGAG Choline Acetyltransferase (CHAT, Accession NM_020984.1) is A A
TGCAGTG another GAM1617 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1617 is therefore inhibition of CHAT, a GAM1617 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1617 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1617 FLNB TTGCCCAGGCTGGAG Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession A A
TGCAGTG NM_001457.1) is another GAM1617 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1617 is therefore inhibition of FLNB, a GAM1617 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1617 include

diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM1617 A TGCAGTG A HTR2A TTGCCCAGGCTGGAG A 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession NM_000621.1) is another GAM1617 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1617 is therefore inhibition of HTR2A, a GAM1617 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1617 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM1617 A TGCAGTG A IAPP TTGCCCAGGCTGGAG A Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM1617 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1617 is therefore inhibition of IAPP, a GAM1617 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM1617 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1617 A TGCAGTG A NOTCH1 TTGCCCAGGCTGGAG A Notch (Drosophila) Homolog 1 (translocation- associated) (NOTCH1, Accession NM_017617.2) is another GAM1617 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING

SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1617 is therefore inhibition of NOTCH1, a GAM1617 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1617 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM1617 A A TGFB1 TGCAGTG TTGCCCAGGCTGGAG TGFB1 (Accession NM_000660.1) is another GAM1617 target gene. TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1617 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1617 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1617 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1650 A A BAX GAATATG TCCAAAAGTGGAGAG BCL2- associated X Protein (BAX, Accession NM_138764.1) is a GAM1650 target gene. BAX BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BAX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BAX BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1650 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1650 is therefore inhibition of BAX, a GAM1650 target gene which accelerates programmed cell death and therefore is associated with Alzheimer. Accordingly, utilities of GAM1650 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BAX.The function of BAX has been established by previous studies. Oltvai et al. (1993) showed that BCL2 associates in vivo with a 21-kD program partner, BAX. BAX shows extensive amino acid homology with BCL2 and forms homodimers and heterodimers with BCL2 in vivo. When BAX predominates, programmed cell death is accelerated, and the death repressor activity of BCL2 is countered. Their findings suggested to Oltvai et al. (1993) a model in which the ratio of BCL2 to BAX determines survival or death following an apoptotic stimulus.

Studies of Bax- deficient mice indicated that the pro- apoptotic BAX molecule can function as a tumor suppressor. For that reason, Meijerink et al. (1998) examined human hematopoietic malignancies and found that approximately 21% of lines possessed mutations in BAX, perhaps most commonly in the acute lymphoblastic leukemia subset. Approximately half were nucleotide insertions or deletions within a deoxyguanosine (G8) tract, resulting in a proximal frameshift and loss of immunodetectable BAX protein. Other BAX mutants bore single amino acid substitutions within BH1 or BH3 domains, demonstrated altered patterns of protein dimerization, and had lost death- promoting activity. LeBlanc et al. (2002) demonstrated that BAX can be essential for death receptor- mediated apoptosis in cancer cells. BAX- deficient human colon carcinoma cells were resistant to death- receptor ligands, whereas BAX-expressing sister clones were sensitive. BAX was dispensable for apical death- receptor signaling events including caspase- 8 (OMIM Ref. No. 601763) activation, but crucial for mitochondrial changes and downstream caspase activation. Treatment of colon cancer cells deficient in DNA mismatch repair with the TRAIL (OMIM Ref. No. 603598) selected in vitro or in vivo for refractory subclones with BAX frameshift mutations including deletions at a novel site. Chemotherapeutic agents upregulated expression of the TRAIL receptor DR5 (OMIM Ref. No. 603612) and the BAX homolog BAK (OMIM Ref. No. 600516) in BAX - /- cells, and restored TRAIL sensitivity in vitro and in vivo. Thus, LeBlanc et al. (2002) concluded that BAX mutation in mismatch repair- deficient tumors can cause resistance to death receptor- targeted therapy, but pre- exposure to chemotherapy rescues tumor sensitivity. Animal model experiments lend further support to the function of BAX. Proapoptotic Bcl2 family members have been proposed to play a central role in regulating apoptosis, yet mice lacking Bax display limited phenotypic abnormalities. Lindsten et al. (2000) found that Bak - /- mice were developmentally normal and reproductively fit and failed to develop any age- related disorders. However, when Bak- deficient mice were mated to Bax-deficient mice to create mice lacking both genes, the majority of Bax- /- Bak- /- animals died perinatally, with fewer than 10% surviving into adulthood. Bax- /- Bak- /- mice displayed multiple developmental defects, including persistence of interdigital webs, an imperforate vaginal canal, and accumulation of excess cells within both the central nervous and hematopoietic systems. Thus, the authors concluded that Bax and Bak have overlapping roles in the regulation of apoptosis during mammalian development and tissue homeostasis.

It is appreciated that the abovementioned animal model for BAX is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the

following publications, the disclosure of which are hereby incorporated by reference:

LeBlanc, H.; Lawrence, D.; Varfolomeev, E.; Totpal, K.; Morlan, J.; Schow, P.; Fong, S.; Schwall, R.; Sinicropi, D.; Ashkenazi, A. : Tumor- cell resistance to death receptor- induced apoptosis through mutational inactivation of the proapoptotic Bcl- 2 homolog Bax. Nature Med. 8: 274- 281, 2002. ; and

Lindsten, T.; Ross, A. J.; King, A.; Zong, W.- X.; Rathmell, J. C.; Shiels, H. A.; Ulrich, E.; Waymire, K. G.; Mahar, P.; Frauwirth, K.; Chen, Y.; Wei, M.; and 9 others : The combined f.

Further studies establishing the function and utilities of BAX are found in John Hopkins OMIM database record ID 600040, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1650 IGF1 TCCAAAAGTGGAGAG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A GAATATG NM_000618.2) is another GAM1650 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1650 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1650 is therefore inhibition of IGF1, a GAM1650 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1650 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1650 APBB2 ATTTTTCTGCATTTG Amyloid Beta (A4) Precursor Protein- binding, Family B, Member B A TATTGGA 2 (Fe65- (APBB2, Accession NM_173075.1) is another GAM1650 target gene. APBB2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1650 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1650 is therefore inhibition of APBB2, a GAM1650 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1650 include diagnosis,

prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1650 B A SLC17A7 ATTTTTCTGCATTTG TATTGGA SOLUTE CARRIER FAMILY 17, MEMBER 7 (SLC17A7, Accession NM_020309.1) is another GAM1650 target gene. SLC17A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC17A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC17A7 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1650 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1650 is therefore inhibition of SLC17A7, a GAM1650 target gene which is a brain- specific Na-dependent inorganic phosphate cotransporter and therefore is associated with Alzheimer. Accordingly, utilities of GAM1650 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC17A7.The function of SLC17A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM1650 B A TNFSF5 ATTTTTCTGCATTTG TATTGGA TNFSF5 (Accession NM_000074.1) is another GAM1650 target gene. TNFSF5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFSF5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1650 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1650 is therefore inhibition of TNFSF5. Accordingly, utilities of GAM1650 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFSF5.

GAM1653 A A A2M TGGAGCAGAAAGGCA GGAGTCC Alpha- 2- macroglobulin (A2M, Accession NM_000014.3) is a GAM1653 target gene. A2M BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by A2M, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of A2M BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1653 is therefore inhibition of A2M, a GAM1653 target gene which inhibit all four classes of proteinases

and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with A2M.The function of A2M has been established by previous studies. Kan et al. (1985) isolated A2M cDNA clones from a human liver cDNA library by using synthetic oligonucleotides as hybridization probes. Matthijs et al. (1992) demonstrated that the A2M gene spans approximately 48 kb and consists of 36 exons, from 21 to 229 bp in size and with consensus splice sites. Intron sizes range from 125 bp to 7.5 kb. The A2M gene is present in single copy in the haploid genome. Umans et al. (1994) found that the homologous gene in the mouse contains 36 exons, coding for a 4.8- kb cDNA. Including putative control elements in the 5- prime flanking region, the gene covers about 45 kb. The promoter region of the mouse A2m gene differed considerably from the known promoter sequences of the human and rat genes. Alpha- 2- macroglobulin, a serum pan- protease inhibitor, has been implicated in Alzheimer disease (AD; 104300) based on its ability to mediate the clearance and degradation of A-beta, the major component of amyloid beta deposits. Blacker et al. (1998) analyzed a deletion in the A2M gene at the 5- prime splice site of 'exon II' of the bait region (exon 18) and found that inheritance of the deletion, designated A2M- 2, conferred increased risk for AD (Mantel- Haenzel odds ratio = 3.56, P = 0.001). The sibship disequilibrium test (SDT) also revealed a significant association between A2M and AD. These values were comparable to those obtained for the APOE4 allele in the same sample, but in contrast to APOE4, A2M- 2 did not affect age of onset. The observed association that A2M with AD did not appear to account for the previously published linkage of AD to chromosome 12, which Blacker et al. (1998) were unable to confirm in their sample. Thus, A2M, the A2M receptor (LRP1; 107770), and the genes for 2 other LRP (low density lipoprotein- related protein) ligands, APOE (OMIM Ref. No. 107741) and APP (OMIM Ref. No. 104760), had all been genetically linked to AD, suggesting that these proteins may participate in the common neuropathogenic pathway leading to the disease. Liao et al. (1998) found an association between the val1000- to- ile polymorphism (103950.0001) and AD.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Umans, L.; Serneels, L.; Hilliker, C.; Stas, L.; Overbergh, L.; De Strooper, B.; Van Leuven, F.; Van den Berghe, H. : Molecular cloning of the mouse gene coding for alpha- 2- macroglobulin and targeting of the gene in embryonic stem cells. Genomics 22: 519-529, 1994. ; and

Liao, A.; Nitsch, R. M.; Greenberg, S. M.; Finckh, U.; Blacker, D.; Albert, M.; Rebeck, G. W.; Gomez- Isla, T.; Clatworthy, A.;

Binetti, G.; Hock, C.; Mueller- Thomsen, T.; Mann, U.; Zuch.

Further studies establishing the function and utilities of A2M are found in John Hopkins OMIM database record ID 103950, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1653 A APBB1 TGGAGCAGAAAGGCA GGAGTCC A Amyloid Beta (A4) Precursor Protein- binding, Family B, Member 1 (Fe65) (APBB1, Accession NM_145689.1) is another GAM1653 target gene. APBB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APBB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of APBB1, a GAM1653 target gene which may modulate the internalization of beta- amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB1.The function of APBB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1653 A CHAT TGGAGCAGAAAGGCA GGAGTCC A Choline Acetyltransferase (CHAT, Accession NM_020986.1) is another GAM1653 target gene. CHAT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of CHAT, a GAM1653 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1653 A DLST TGGAGCAGAAAGGCA GGAGTCC A Dihydrolipoamide S- succinyltransferase (E2 component of 2-oxo- glutarat (DLST, Accession NM_001933.2) is another GAM1653 target gene. DLST BINDING SITE1 and DLST BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DLST, corresponding to target binding sites such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE1 and DLST BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of DLST, a GAM1653 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM1653 FPRL1 TGGAGCAGAAAGGCA FPRL1 (Accession NM_001462.1) is another GAM1653 target gene.
A A

GGAGTCC FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of FPRL1. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM1653 HTR2C TGGAGCAGAAAGGCA 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession
A A

GGAGTCC NM_000868.1) is another GAM1653 target gene. HTR2C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of HTR2C, a GAM1653 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM1653 MPO TGGAGCAGAAAGGCA Myeloperoxidase (MPO, Accession NM_000250.1) is another
GAM1653 A A

GGAGTCC target gene. MPO BINDING SITE is a target binding site found in the

3` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of MPO, a GAM1653 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM1653 PRND TGGAGCAGAAAGGCA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A
GGAGTCC another GAM1653 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of PRND, a GAM1653 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1653 SLC6A4 TGGAGCAGAAAGGCA Solute Carrier Family 6 (neurotransmitter transporter, A A
GGAGTCC serotonin), Mem (SLC6A4, Accession NM_001045.1) is another GAM1653 target gene. SLC6A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC6A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC6A4 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of SLC6A4, a GAM1653 target gene which terminates the action of serotonine by its high affinity sodium- dependent reuptake into presynaptic terminals. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical

conditions associated with SLC6A4.The function of SLC6A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1294.

GAM1653 TGFB1 TGGAGCAGAAAGGCA A A GGAGTCC TGFB1 (Accession NM_000660.1) is another GAM1653 target gene. TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1653 TNFRSF5 TGGAGCAGAAAGGCA A A GGAGTCC TNFRSF5 (Accession NM_152854.1) is another GAM1653 target gene. TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1653 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1653 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM1653 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM1698 CRAT CTTGGCCCTGTGAGG A A CTTCACC Carnitine Acetyltransferase (CRAT, Accession NM_004003.2) is a GAM1698 target gene. CRAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CRAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1698 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1698 is therefore inhibition of CRAT, a GAM1698 target gene which catalyzes the reversible transfer of acyl groups from an acyl- CoA thioester to carnitine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1698 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRAT.The function of CRAT and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM1698 A A DHCR24 CTTGGCCCTGTGAGG CTTCACC 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is another GAM1698 target gene. DHCR24 BINDING SITE1 and DHCR24 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DHCR24, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE1 and DHCR24 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1698 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1698 is therefore inhibition of DHCR24, a GAM1698 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1698 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1698 A A MPO CTTGGCCCTGTGAGG CTTCACC Myeloperoxidase (MPO, Accession NM_000250.1) is another GAM1698 target gene. MPO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1698 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1698 is therefore inhibition of MPO, a GAM1698 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1698 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM1698 A A SNCB CTTGGCCCTGTGAGG CTTCACC Synuclein, Beta (SNCB, Accession NM_003085.2) is another GAM1698 target gene. SNCB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1698 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1698 is therefore inhibition of SNCB, a GAM1698 target gene which may inhibit phospholipase D2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1698 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCB.The function of SNCB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM1698 TRPM2 CTTGGCCCTGTGAGG TRPM2 (Accession NM_003307.1) is another GAM1698 target gene. A A
CTTCACC TRPM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1698 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1698 is therefore inhibition of TRPM2, a GAM1698 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM1698 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1735 APLP2 TGAGATGAACCAGGT Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession A A
ATCTCAG NM_001642.1) is a GAM1735 target gene. APLP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1735 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1735 is therefore inhibition of APLP2, a GAM1735 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1735 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM1735 FLNB TGAGATGAACCAGGT Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession A A
ATCTCAG NM_001457.1) is another GAM1735 target gene. FLNB BINDING SITE1 and FLNB BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FLNB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of

Fig.8. Nucleotide sequences of FLNB BINDING SITE1 and FLNB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1735 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1735 is therefore inhibition of FLNB, a GAM1735 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1735 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM1748 ARHA ACTGCACTCCAGTCT Ras Homolog Gene Family, Member A (ARHA, Accession NM_001664.1) A A

GGGTGAC is a GAM1748 target gene. ARHA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ARHA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1748 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1748 is therefore inhibition of ARHA, a GAM1748 target gene which regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1748 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ARHA.The function of ARHA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.

GAM1748 BACE ACTGCACTCCAGTCT Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A

GGGTGAC is another GAM1748 target gene. BACE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1748 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1748 is therefore inhibition of BACE, a GAM1748 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1748 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function

of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1748 FHL2 ACTGCACTCCAGTCT A A GGGTGAC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is another GAM1748 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1748 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1748 is therefore inhibition of FHL2, a GAM1748 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1748 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM1748 FPRL1 ACTGCACTCCAGTCT A A GGGTGAC FPRL1 (Accession NM_001462.1) is another GAM1748 target gene. FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1748 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1748 is therefore inhibition of FPRL1. Accordingly, utilities of GAM1748 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM1748 IGF1 ACTGCACTCCAGTCT A A GGGTGAC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM1748 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1748 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1748 is therefore inhibition of IGF1, a GAM1748 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1748 include diagnosis, prevention and treatment of Alzheimer,

and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1748 PRND ACTGCACTCCAGTCT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A
GGGTGAC another GAM1748 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1748 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1748 is therefore inhibition of PRND, a GAM1748 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1748 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1770 A2M TGGAGCAGAAAGGCA Alpha- 2- macroglobulin (A2M, Accession NM_000014.3) is a A A
GGAGTCC GAM1770 target gene. A2M BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by A2M, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of A2M BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1770 is therefore inhibition of A2M, a GAM1770 target gene which inhibit all four classes of proteinases and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with A2M.The function of A2M and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1653.

GAM1770 APBB1 TGGAGCAGAAAGGCA Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A
GGAGTCC 1 (Fe65) (APBB1, Accession NM_145689.1) is another GAM1770 target gene. APBB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APBB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set

forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of APBB1, a GAM1770 target gene which may modulate the internalization of beta- amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB1.The function of APBB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1770 CHAT TGGAGCAGAAAGGCA Choline Acetyltransferase (CHAT, Accession NM_020986.1) is A A

GGAGTCC another GAM1770 target gene. CHAT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of CHAT, a GAM1770 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM1770 DLST TGGAGCAGAAAGGCA Dihydrolipoamide S- succinyltransferase (E2 component of 2- A A

GGAGTCC oxo- glutarat (DLST, Accession NM_001933.2) is another GAM1770 target gene. DLST BINDING SITE1 and DLST BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DLST, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE1 and DLST BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of DLST, a GAM1770 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM1770 FPRL1 TGGAGCAGAAAGGCA FPRL1 (Accession NM_001462.1) is another GAM1770 target gene.
A A

GGAGTCC FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of FPRL1. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM1770 HTR2C TGGAGCAGAAAGGCA 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession
A A

GGAGTCC NM_000868.1) is another GAM1770 target gene. HTR2C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of HTR2C, a GAM1770 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM1770 MPO TGGAGCAGAAAGGCA Myeloperoxidase (MPO, Accession NM_000250.1) is another
GAM1770 A A

GGAGTCC target gene. MPO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of MPO, a GAM1770 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been

established by previous studies, as described hereinabove with reference to GAM1032.

GAM1770 PRND TGGAGCAGAAAGGCA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A
GGAGTCC another GAM1770 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of PRND, a GAM1770 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1770 SLC6A4 TGGAGCAGAAAGGCA Solute Carrier Family 6 (neurotransmitter transporter, A A
GGAGTCC serotonin), Mem (SLC6A4, Accession NM_001045.1) is another GAM1770 target gene. SLC6A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC6A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC6A4 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of SLC6A4, a GAM1770 target gene which terminates the action of serotonine by its high affinity sodium- dependent reuptake into presynaptic terminals. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC6A4.The function of SLC6A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1294.

GAM1770 TGFB1 TGGAGCAGAAAGGCA TGFB1 (Accession NM_000660.1) is another GAM1770 target gene. A A
GGAGTCC TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1770 TNFRSF5 TGGAGCAGAAAGGCA A A GGAGTCC TNFRSF5 (Accession NM_152854.1) is another GAM1770 target gene. TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1770 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM1770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM1782 ADAM17 ATCACAGAGGCTTAA A A GTGCTGA A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, (ADAM17, Accession NM_021832.1) is a GAM1782 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1782 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1782 is therefore inhibition of ADAM17, a GAM1782 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1782 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1782 GFAP ATCACAGAGGCTTAA A A GTGCTGA GFAP (Accession NM_002055.2) is another GAM1782 target gene. GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1782 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1782 is therefore inhibition of

GFAP. Accordingly, utilities of GAM1782 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM1782 MME ATCACAGAGGCTTAA GTGCTGA Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_007288.1) is another GAM1782 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1782 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1782 is therefore inhibition of MME, a GAM1782 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1782 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1782 MTNR1A ATCACAGAGGCTTAA GTGCTGA Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is another GAM1782 target gene. MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MTNR1A, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1782 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1782 is therefore inhibition of MTNR1A, a GAM1782 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1782 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM1782 NCKAP1 ATCACAGAGGCTTAA GTGCTGA NCKAP1 (Accession NM_013436.2) is another GAM1782 target gene. NCKAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1782 RNA are set forth in Tables 6 and 7, hereby A A

incorporated herein.

Another function of GAM1782 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM1782 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM1782 A A PSEN1 ATCACAGAGGCTTAA GTGCTGA PSEN1 (Accession NM_007318.1) is another GAM1782 target gene. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1782 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1782 is therefore inhibition of PSEN1. Accordingly, utilities of GAM1782 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM1782 A A RAGE ATCACAGAGGCTTAA GTGCTGA Renal Tumor Antigen (RAGE, Accession NM_014226.1) is another GAM1782 target gene. RAGE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by RAGE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of RAGE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1782 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1782 is therefore inhibition of RAGE, a GAM1782 target gene which is essential for the completion of the start, the controlling event, in the cell cycle and therefore is associated with Alzheimer. Accordingly, utilities of GAM1782 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with RAGE.The function of RAGE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1523.

GAM1820 A A ADAM10 AGGCTGCAGTGTAGT GGCATGA A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM_001110.1) is a GAM1820 target gene. ADAM10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1820 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1820 is therefore inhibition of ADAM10, a

GAM1820 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1820 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM10.The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1300.

GAM1820 ADAM17 AGGCTGCAGTGTAGT A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A
GGCATGA factor, (ADAM17, Accession NM_003183.3) is another GAM1820 target gene. ADAM17 BINDING SITE1 through ADAM17 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ADAM17, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE1 through ADAM17 BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM1820 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1820 is therefore inhibition of ADAM17, a GAM1820 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1820 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1820 FPRL1 AGGCTGCAGTGTAGT FPRL1 (Accession NM_001462.1) is another GAM1820 target gene. A A
GGCATGA FPRL1 BINDING SITE1 and FPRL1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FPRL1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE1 and FPRL1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1820 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1820 is therefore inhibition of FPRL1. Accordingly, utilities of GAM1820 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM1820 HADH2 AGGCTGCAGTGTAGT Hydroxyacyl- Coenzyme A Dehydrogenase, Type II (HADH2, A A
GGCATGA Accession NM_004493.1) is another GAM1820 target gene. HADH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HADH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HADH2 BINDING SITE, and secondary structure

complementarity to the nucleotide sequence of GAM1820 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1820 is therefore inhibition of HADH2, a GAM1820 target gene which catalyzes the reversible oxidation of L- 3- hydroxyacyl- CoAs to form 3- ketoacyl- CoAs and binds intracellular amyloid- beta. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1820 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HADH2.The function of HADH2 has been established by previous studies. Amyloid- beta (OMIM Ref. No. 104760) is a neurotoxic peptide that is implicated in the pathogenesis of Alzheimer disease (AD; 104300). Yan et al. (1997) demonstrated that amyloid- beta binds an intracellular polypeptide, which they designated ERAB. They used the yeast 2- hybrid system to screen human brain and HeLa- cell cDNA libraries for encoded proteins capable of binding to a fusion protein containing amyloid- beta peptide. The full- length cDNA sequence they identified encodes a predicted 262- amino acid polypeptide (GenBank U96132). Sequence comparisons indicated that ERAB most resembles the family of short- chain alcohol dehydrogenases, including hydroxysteroid dehydrogenases (see OMIM Ref. No. 109684). The authors showed that ERAB is expressed in normal tissues but is overexpressed in neurons affected in AD. ERAB immunoprecipitates with amyloid- beta, and when cell cultures are exposed to amyloid- beta, ERAB inside the cell is rapidly redistributed to the plasma membrane. Yan et al. (1997) also found that the toxic effect of amyloid- beta on these cells is prevented by blocking ERAB with an anti- ERAB antibody fragment and is enhanced by overexpression of ERAB. The authors concluded that, by interacting with intracellular amyloid- beta, ERAB may contribute to the neuronal dysfunction associated with Alzheimer disease. In a note added in proof, Yan et al. (1997) noted that a human gene identical to ERAB and mapped to the X chromosome had been entered in GenBank by O. P. Zuchenko and colleagues (unpublished). Furthermore, Furuta et al. (1997) reported cloning a bovine cDNA that is the homolog of human ERAB. He et al. (1998) independently cloned a novel L- 3- hydroxyacyl- CoA dehydrogenase from human brain. They found the enzyme to be a homotetramer with a molecular mass of 108 kD. Its subunit consists of 261 amino acid residues and has structural features characteristic of short- chain dehydrogenases. He et al. (1998) found that the amino acid sequence of this human brain enzyme was identical to that of ERAB, which mediates neurotoxicity in Alzheimer disease. The purification of human brain short- chain L- 3- hydroxyacyl- CoA dehydrogenase made it possible to characterize the structural and catalytic properties of ERAB. This NAD( )- dependent dehydrogenase catalyzes the reversible oxidation of L- 3- hydroxyacyl- CoAs to form 3- ketoacyl- CoAs, but it does not act on the D- isomers. The human short- chain L- 3- hydroxyacyl- CoA dehydrogenase gene is organized into 6 exons and 5 introns and spans approximately 4 kb. The amino- terminal NAD- binding region of the

hydrogenase is encoded by the first 3 exons, whereas the other exons code for the carboxy- terminal substrate- binding regions harboring putative catalytic residues.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Yan, S. D.; Fu, J.; Soto, C.; Chen, X.; Zhu, H.; Al- Mohanna, F.; Collison, K.; Zhu, A.; Stern, E.; Saido, T.; Tohyama, M.; Ogawa, S.; Roher, A.; Stern, D. : An intracellular protein that binds amyloid- beta peptide and mediates neurotoxicity in Alzheimer's disease. Nature 389: 689- 695, 1997. ; and

He, X.- Y.; Schulz, H.; Yang, S.- Y. : A human brain L- 3- hydroxyacyl- coenzyme A dehydrogenase is identical to an amyloid beta- peptide- binding protein involved in Alzheimer's disease. J. Bi.

Further studies establishing the function and utilities of HADH2 are found in John Hopkins OMIM database record ID 300256, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1820 NCKAP1 AGGCTGCAGTGTAGT NCKAP1 (Accession NM_013436.2) is another GAM1820 target gene. A A

GGCATGA NCKAP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1820 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1820 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM1820 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM1820 PRND AGGCTGCAGTGTAGT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

GGCATGA another GAM1820 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1820 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1820 is therefore inhibition of PRND, a GAM1820 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities

of GAM1820 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1835 DSCR1 TCAACTATGATTACC AAAGCAG Down Syndrome Critical Region Gene 1 (DSCR1, Accession NM_004414.3) is a GAM1835 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1835 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1835 is therefore inhibition of DSCR1, a GAM1835 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1835 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM1860 NOTCH1 TTAAAGTCACCATTT GTGGGTT Notch (Drosophila) Homolog 1 (translocation- associated) (NOTCH1, Accession NM_017617.2) is a GAM1860 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1860 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1860 is therefore inhibition of NOTCH1, a GAM1860 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1860 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM1863 BACE TGCTAGGTTTTTTCC TTTCCCC Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) is a GAM1863 target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, and secondary structure complementarity to the nucleotide A A

sequence of GAM1863 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1863 is therefore inhibition of BACE, a GAM1863 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1863 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1863 GYPA TGCTAGGTTTTTTCC Glycophorin A (includes MN blood group) (GYPA, Accession A A TTTCCCC NM_002099.2) is another GAM1863 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1863 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1863 is therefore inhibition of GYPA, a GAM1863 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1863 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1864 IGF1 TCGAGTTGATGCTAG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A AATGGGT NM_000618.2) is a GAM1864 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1864 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1864 is therefore inhibition of IGF1, a GAM1864 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1864 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1887 BACE TTCTCATTGGCCCAC Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A

AGGGGTA is a GAM1887 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1887 is therefore inhibition of BACE, a GAM1887 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1896 DHCR24 TTCCTCTGCCACGTC 24- dehydrocholesterol Reductase (DHCR24, Accession A A
TTTCCCT NM_014762.1) is a GAM1896 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1896 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1896 is therefore inhibition of DHCR24, a GAM1896 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1896 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1896 DLST TTCCTCTGCCACGTC Dihydrolipoamide S- succinyltransferase (E2 component of 2- A A
TTTCCCT oxo- glutarat (DLST, Accession NM_001933.2) is another GAM1896 target gene. DLST BINDING SITE1 and DLST BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DLST, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE1 and DLST BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1896 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1896 is therefore inhibition of DLST, a GAM1896 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1896 include diagnosis,

prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM1896 MAPK10 TTCCTCTGCCACGTC Mitogen- activated Protein Kinase 10 (MAPK10, Accession A A
TTTCCCT NM_002753.2) is another GAM1896 target gene. MAPK10 BINDING SITE1 and MAPK10 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MAPK10, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE1 and MAPK10 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1896 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1896 is therefore inhibition of MAPK10, a GAM1896 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1896 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM1896 MAPT TTCCTCTGCCACGTC Microtubule- associated Protein Tau (MAPT, Accession A A
TTTCCCT NM_005910.2) is another GAM1896 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1896 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1896 is therefore inhibition of MAPT, a GAM1896 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1896 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM1896 PSEN1 TTCCTCTGCCACGTC PSEN1 (Accession NM_007319.1) is another GAM1896 target gene. A A
TTTCCCT PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA

encoded by PSEN1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1896 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1896 is therefore inhibition of PSEN1. Accordingly, utilities of GAM1896 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM1914 TNF TTCTACTAGTGGTTG ATGGCCT Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, Accession NM_000594.2) is a GAM1914 target gene. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1914 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1914 is therefore inhibition of TNF, a GAM1914 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly, utilities of GAM1914 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNF.The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1937 ACE TGAGTATTCACCAGG TGCTGGG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM1937 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1937 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM1937 is therefore inhibition of ACE, a GAM1937 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM1937 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1937 ADAM17 TGAGTATTCACCAGG TGCTGGG A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, (ADAM17, Accession NM_021832.1) is another GAM1937 target A A

gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1937 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1937 is therefore inhibition of ADAM17, a GAM1937 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1937 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1937 CAV1 TGAGTATTCACCAGG TGCTGGG Caveolin 1, Caveolae Protein, 22kD (CAV1, Accession NM_001753.3) is another GAM1937 target gene. CAV1 BINDING SITE1 and CAV1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by CAV1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV1 BINDING SITE1 and CAV1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1937 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1937 is therefore inhibition of CAV1, a GAM1937 target gene which may act as a scaffolding protein within caveolar membranes, and interacts directly with g- protein alpha subunits and can functionally regulate their activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1937 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV1.The function of CAV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1087.

GAM1937 GYPA TGAGTATTCACCAGG TGCTGGG Glycophorin A (includes MN blood group) (GYPA, Accession NM_002099.2) is another GAM1937 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1937 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM1937 is therefore inhibition of GYPA, a GAM1937 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities

of GAM1937 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1937 NOTCH1 TGAGTATTCACCAGG Notch (Drosophila) Homolog 1 (translocation- associated) A A

TGCTGGG (NOTCH1, Accession NM_017617.2) is another GAM1937 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1937 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1937 is therefore inhibition of NOTCH1, a GAM1937 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1937 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM1937 PSEN2 TGAGTATTCACCAGG PSEN2 (Accession NM_012486.1) is another GAM1937 target gene. A A

TGCTGGG PSEN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1937 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1937 is therefore inhibition of PSEN2. Accordingly, utilities of GAM1937 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN2.

GAM1942 BCHE AGCAAGATGGTAGCA BCHE (Accession NM_000055.1) is a GAM1942 target gene. BCHE A A

TTGGAGA BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by BCHE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BCHE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1942 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1942 is therefore inhibition of BCHE. Accordingly, utilities of GAM1942 include diagnosis, prevention and

treatment of Alzheimer, and of other diseases and clinical conditions associated with BCHE.

GAM1942 HD AGCAAGATGGTAGCA HD (Accession NM_002111.3) is another GAM1942 target gene. HD A A

TTGGAGA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1942 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1942 is therefore inhibition of HD. Accordingly, utilities of GAM1942 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM1942 MME AGCAAGATGGTAGCA Membrane Metallo- endopeptidase (neutral endopeptidase, A A

TTGGAGA enkephalinase, (MME, Accession NM_000902.2) is another GAM1942 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1942 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1942 is therefore inhibition of MME, a GAM1942 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1942 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1942 PRNP AGCAAGATGGTAGCA Prion Protein (p27- 30) (Creutzfeld- Jakob disease, Gerstmann- A A

TTGGAGA Strausler- (PRNP, Accession NM_000311.1) is another GAM1942 target gene. PRNP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRNP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRNP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1942 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1942 is therefore inhibition of PRNP, a GAM1942 target gene which the function of prp is not known. prp is encoded in the host genome and is expressed both in normal and infected cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1942 include diagnosis, prevention and

treatment of Alzheimer, and of other diseases and clinical conditions associated with PRNP.The function of PRNP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM1961 ADAM17 CAAAGTGCTGAGATT A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A

ACAGGCA factor, (ADAM17, Accession NM_003183.3) is a GAM1961 target gene. ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ADAM17, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1961 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1961 is therefore inhibition of ADAM17, a GAM1961 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1961 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM1961 GFAP CAAAGTGCTGAGATT GFAP (Accession NM_002055.2) is another GAM1961 target gene. A A

ACAGGCA GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1961 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1961 is therefore inhibition of GFAP. Accordingly, utilities of GAM1961 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM1961 HTR2A CAAAGTGCTGAGATT 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession A A

ACAGGCA NM_000621.1) is another GAM1961 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1961 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1961 is therefore inhibition of HTR2A, a GAM1961 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1961 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM1961 HTR2C CAAAGTGCTGAGATT A A ACAGGCA 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868.1) is another GAM1961 target gene. HTR2C BINDING SITE1 and HTR2C BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HTR2C, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE1 and HTR2C BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1961 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1961 is therefore inhibition of HTR2C, a GAM1961 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1961 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM1961 IAPP CAAAGTGCTGAGATT A A ACAGGCA Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM1961 target gene. IAPP BINDING SITE1 through IAPP BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by IAPP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE1 through IAPP BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM1961 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1961 is therefore inhibition of IAPP, a GAM1961 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM1961 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM1961 MTNR1A CAAAGTGCTGAGATT A A Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is

ACAGGCA another GAM1961 target gene. MTNR1A BINDING SITE1 through MTNR1A BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by MTNR1A, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE1 through MTNR1A BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM1961 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1961 is therefore inhibition of MTNR1A, a GAM1961 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1961 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM1961 TGFB1 CAAAGTGCTGAGATT TGFB1 (Accession NM_000660.1) is another GAM1961 target gene.
A A

ACAGGCA TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1961 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1961 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1961 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1975 IGF1 TTCCAAGCCTTCCCC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
GGGATCA NM_000618.2) is a GAM1975 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1975 is therefore inhibition of IGF1, a GAM1975 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1975 CLU TGGTGGGGAGAGGCT Clusterin (complement lysis inhibitor, SP- 40,40, sulfated B A
TGGGAAG glycoprotein (CLU, Accession NM_001831.1) is another GAM1975 target gene. CLU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CLU BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1975 is therefore inhibition of CLU, a GAM1975 target gene which has a role in the terminal complement reaction. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CLU.The function of CLU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1144.

GAM1975 DHCR24 TGGTGGGGAGAGGCT 24- dehydrocholesterol Reductase (DHCR24, Accession B A
TGGGAAG NM_014762.1) is another GAM1975 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1975 is therefore inhibition of DHCR24, a GAM1975 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM1975 LRP1 TGGTGGGGAGAGGCT Low Density Lipoprotein- related Protein 1 (alpha- 2- B A
TGGGAAG macroglobulin recep (LRP1, Accession NM_002332.1) is another GAM1975 target gene. LRP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LRP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of LRP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1975 is therefore inhibition of LRP1, a GAM1975 target gene which is a recycling lipoprotein

receptor with possible growth- modulating effects. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with LRP1.The function of LRP1 has been established by previous studies. Herz et al. (1988) cloned a cDNA for the low density lipoprotein receptor- related protein (LRP) by virtue of its close homology to the LDL receptor (OMIM Ref. No. 606945). Kristensen et al. (1990) and Strickland et al. (1990) demonstrated that LRP is identical to the alpha- 2- macroglobulin (A2M; 103950) receptor (A2MR). Like the mannose- 6- phosphate receptor (OMIM Ref. No. 147280), the A2MR/LRP molecule is probably bifunctional The heat- shock protein gp96 (TRA1; 191175) is an intracellular protein capable of chaperoning exogenous antigens from tumors or virus- infected cells to antigen- presenting cells for presentation through major histocompatibility complex (MHC) class I rather than class II molecules, thereby eliciting CD8 (OMIM Ref. No. 186910)- positive T- cell responses. Using a mouse system, Binder et al. (2000) determined that the receptor for gp96 is CD91 (A2MR) and that A2M, a protein found in blood, inhibits gp96 binding to CD91. They proposed that CD91 acts as a sensor for necrotic cell death in tissues, leading to proinflammatory immune responses

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Strickland, D. K.; Ashcom, J. D.; Williams, S.; Burgess, W. H.; Migliorini, M.; Argraves, W. S. : Sequence identity between the alpha- 2- macroglobulin receptor and low density lipoprotein receptor- related protein suggests that this molecule is a multifunctional receptor. J. Biol. Chem. 265: 17401- 17404, 1990. ; and

Binder, R. J.; Han, D. K.; Srivastava, P. K. : CD91: a receptor for heat shock protein gp96. Nature Immun. 1: 151- 155, 2000.

Further studies establishing the function and utilities of LRP1 are found in John Hopkins OMIM database record ID 107770, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1975 MAPT TGGTGGGGAGAGGCT TGGGAAG Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM1975 target gene. MAPT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM1975 is therefore inhibition of MAPT, a GAM1975 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM1975 OLR1 TGGTGGGGAGAGGCT Oxidised Low Density Lipoprotein (lectin- like) Receptor 1 B A TGGGAAG (OLR1, Accession NM_002543.1) is another GAM1975 target gene. OLR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OLR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OLR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1975 is therefore inhibition of OLR1, a GAM1975 target gene which is involved in degradation of oxidized LDL by vascular endothelial cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OLR1.The function of OLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM1975 TGFB1 TGGTGGGGAGAGGCT TGFB1 (Accession NM_000660.1) is another GAM1975 target gene. B A TGGGAAG TGFB1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1975 is therefore inhibition of TGFB1. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM1975 TNF TGGTGGGGAGAGGCT Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, B A TGGGAAG Accession NM_000594.2) is another GAM1975 target gene. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1975 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1975 is therefore inhibition of TNF, a GAM1975 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly, utilities of GAM1975 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNF.The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1976 ABCD1 CTGGCTCCCTCTCTT ABCD1 (Accession NM_000033.2) is a GAM1976 target gene. ABCD1 A A

CTCTCCC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ABCD1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1976 is therefore inhibition of ABCD1. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ABCD1.

GAM1976 BACE CTGGCTCCCTCTCTT Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A

CTCTCCC is another GAM1976 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of BACE, a GAM1976 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM1976 CRH CTGGCTCCCTCTCTT Corticotropin Releasing Hormone (CRH, Accession NM_000756.1) is A A

CTCTCCC another GAM1976 target gene. CRH BINDING SITE1 through CRH BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by CRH, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRH BINDING SITE1 through CRH BINDING SITE3,

and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of CRH, a GAM1976 target gene which regulates the release of corticotropin from pituitary gland. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRH.The function of CRH has been established by previous studies. Response to stress in mammals requires an intact hypothalamic- pituitary- adrenal axis. The proximal part of the response is mediated by secretion of corticotropin- releasing hormone (CRH) by the paraventricular nucleus of the hypothalamus. CRH is a 41- amino acid peptide derived by enzymatic cleavage from a 191- amino acid preprohormone. Shibahara et al. (1983) cloned and sequenced the human CRH gene. Arbiser et al. (1988) assigned the gene for CRH to 8q13 by somatic cell hybrid and in situ hybridization studies. The absence of secondary hybridization strongly suggested that hypothalamic and placental CRH are transcribed from the same gene. Kellogg et al. (1989) corroborated the assignment to 8q13 by in situ hybridization. Knapp et al. (1993) showed that the homologous gene is located on mouse chromosome 3 Sebaceous glands may be involved in a pathway conceptually similar to that of the hypothalamic- pituitary- adrenal (HPA) axis. CRH is the most proximal element of the HPA axis, and it acts as a central coordinator for neuroendocrine and behavioral responses to stress. To examine the probability of an HPA equivalent pathway in sebaceous glands, Zouboulis et al. (2002) investigated the expression of CRH, CRH- binding protein, CRHBP (OMIM Ref. No. 122559), and CRH receptors (CRHR1, 122561 and CRHR2, 602034) in sebocytes in vitro and their regulation by CRH and several other hormones. CRHR1 was the predominant type, being twice as abundant as CRHR2. CRH was biologically active on human sebocytes; it induced biphasic increase in synthesis of sebaceous lipids, although it did not affect cell viability, cell proliferation, or IL1B (OMIM Ref. No. 147720)- induced IL8 (OMIM Ref. No. 146930) release. Zouboulis et al. (2002) interpreted these and other findings as indicating that CRH may be an autocrine hormone for human sebocytes that exerts homeostatic lipogenic activity, whereas testosterone and growth hormone induced CRH negative feedback. The findings implicated CRH in the clinical development of acne, seborrhea, androgenetic alopecia, skin aging, xerosis, and other skin disorders associated with alterations in lipid formation of sebaceous origin Animal model experiments lend further support to the function of CRH. In adult male rhesus macaques, Habib et al. (2000) evaluated the effects of a lipophilic nonpeptide antagonist to CRH type 1 receptor, antalarmin, on the behavioral, neuroendocrine, and autonomic components of the stress response. After oral administration, significant antalarmin concentrations were detected in the systemic circulation and the

cerebrospinal fluid. The monkeys were exposed to an intense social stressor, namely, placement of 2 unfamiliar males in adjacent cages separated only by a transparent Plexiglas screen. Antalarmin significantly inhibited a repertoire of behaviors associated with anxiety and fear, such as body tremors, grimacing, teeth gnashing, urination, and defecation. In contrast, antalarmin increased exploratory and sexual behaviors that are normally suppressed during stress. Moreover, antalarmin significantly diminished the increases in cerebrospinal fluid CRH as well as the pituitary- adrenal, sympathetic, and adrenal medullary responses to stress. Habib et al. (2000) suggested that a CRH type 1 receptor antagonist may be of therapeutic value in human psychiatric, reproductive, and cardiovascular disorders associated with CRH system hyperactivity.

It is appreciated that the abovementioned animal model for CRH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Knapp, L. T.; Keegan, C. E.; Seasholtz, A. F.; Camper, S. A. : Corticotropin- releasing hormone (Crh) maps to mouse chromosome 3. Mammalian Genome 4: 615- 617, 1993. ; and

Habib, K. E.; Weld, K. P.; Rice, K. C.; Pushkas, J.; Champoux, M.; Listwak, S.; Webster, E. L.; Atkinson, A. J.; Schulkin, J.; Contoreggi, C.; Chrousos, G. P.; McCann, S. M.; Suomi, S. J.

Further studies establishing the function and utilities of CRH are found in John Hopkins OMIM database record ID 122560, and in cited publications listed in Table 9, hereby incorporated herein.

GAM1976	DLST	CTGGCTCCCTCTCTT CTCTCCC	Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM1976 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM1976 is therefore inhibition of DLST, a GAM1976 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM1976 FLNB CTGGCTCCCTCTCTT A A CTCTCCC Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is another GAM1976 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of FLNB, a GAM1976 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM1976 GFAP CTGGCTCCCTCTCTT A A CTCTCCC GFAP (Accession NM_002055.2) is another GAM1976 target gene. GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of GFAP. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM1976 GLUL CTGGCTCCCTCTCTT A A CTCTCCC Glutamate- ammonia Ligase (glutamine synthase) (GLUL, Accession NM_002065.3) is another GAM1976 target gene. GLUL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLUL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GLUL BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of GLUL, a GAM1976 target gene which catalyzes the condensation of glutamate and ammonia to form glutamine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and

clinical conditions associated with GLUL.The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM519.

GAM1976 HD CTGGCTCCCTCTCTT HD (Accession NM_002111.3) is another GAM1976 target gene. HD A A

CTCTCCC BINDING SITE1 through HD BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by HD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE1 through HD BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of HD. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM1976 LRP1 CTGGCTCCCTCTCTT Low Density Lipoprotein- related Protein 1 (alpha- 2- A A

CTCTCCC macroglobulin recep (LRP1, Accession NM_002332.1) is another GAM1976 target gene. LRP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by LRP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of LRP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of LRP1, a GAM1976 target gene which is a recycling lipoprotein receptor with possible growth- modulating effects. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with LRP1.The function of LRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1975.

GAM1976 MPO CTGGCTCCCTCTCTT Myeloperoxidase (MPO, Accession NM_000250.1) is another GAM1976 A A

CTCTCCC target gene. MPO BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of MPO, a GAM1976 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with

Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM1976 A A CTCTCCC NGB CTGGCTCCCTCTCTT Neuroglobin (NGB, Accession NM_021257.2) is another GAM1976 target gene. NGB BINDING SITE1 and NGB BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NGB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE1 and NGB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of NGB, a GAM1976 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM1976 A A CTCTCCC PSEN2 CTGGCTCCCTCTCTT PSEN2 (Accession NM_000447.1) is another GAM1976 target gene. PSEN2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PSEN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of PSEN2. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN2.

GAM1976 A A CTCTCCC SLC6A4 CTGGCTCCCTCTCTT Solute Carrier Family 6 (neurotransmitter transporter, serotonin), Mem (SLC6A4, Accession NM_001045.1) is another GAM1976 target gene. SLC6A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC6A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC6A4 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of

SLC6A4, a GAM1976 target gene which terminates the action of serotonine by its high affinity sodium- dependent reuptake into presynaptic terminals. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC6A4.The function of SLC6A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1294.

GAM1976 TFCP2 CTGGCTCCCTCTCTT Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is A A
CTCTCCC another GAM1976 target gene. TFCP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TFCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of TFCP2, a GAM1976 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM760.

GAM1976 THOP1 CTGGCTCCCTCTCTT Thimet Oligopeptidase 1 (THOP1, Accession NM_003249.2) is A A
CTCTCCC another GAM1976 target gene. THOP1 BINDING SITE1 and THOP1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by THOP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of THOP1 BINDING SITE1 and THOP1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM1976 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1976 is therefore inhibition of THOP1, a GAM1976 target gene which involves in the metabolism of neuropeptide and in cytoplasmic peptide degradation. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1976 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with THOP1.The function of THOP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM520.

GAM1997 LRP1 ACTCAGAGCCATTCC Low Density Lipoprotein- related Protein 1 (alpha- 2- A A
GCTCAGG macroglobulin recep (LRP1, Accession NM_002332.1) is a GAM1997

target gene. LRP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by LRP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of LRP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1997 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM1997 is therefore inhibition of LRP1, a GAM1997 target gene which is a recycling lipoprotein receptor with possible growth- modulating effects. and therefore is associated with Alzheimer. Accordingly, utilities of GAM1997 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with LRP1.The function of LRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1975.

GAM1997 IGF1 AGCGGAGACCTGAGC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession B A

TATGAGT NM_000618.2) is another GAM1997 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM1997 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM1997 is therefore inhibition of IGF1, a GAM1997 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM1997 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2010 FHL2 CATTGCACTCCACCC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

TAGGCAA a GAM2010 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2010 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2010 is therefore inhibition of FHL2, a GAM2010 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2010 include diagnosis, prevention and

treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2010 HD CATTGCACTCCACCC HD (Accession NM_002111.3) is another GAM2010 target gene. HD A A

TAGGCAA BINDING SITE1 and HD BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE1 and HD BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2010 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2010 is therefore inhibition of HD. Accordingly, utilities of GAM2010 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2010 IGF1 CATTGCACTCCACCC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

TAGGCAA NM_000618.2) is another GAM2010 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2010 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2010 is therefore inhibition of IGF1, a GAM2010 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2010 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2010 PRND CATTGCACTCCACCC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

TAGGCAA another GAM2010 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2010 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2010 is therefore inhibition of

PRND, a GAM2010 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2010 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2014 ABCD1 GCTTCTCCTGTCCCC ABCD1 (Accession NM_000033.2) is a GAM2014 target gene. ABCD1 A A

TCCCTAC BINDING SITE1 and ABCD1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by ABCD1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ABCD1 BINDING SITE1 and ABCD1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2014 is therefore inhibition of ABCD1. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ABCD1.

GAM2014 APBB1 GCTTCTCCTGTCCCC Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

TCCCTAC 1 (Fe65) (APBB1, Accession NM_001164.2) is another GAM2014 target gene. APBB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APBB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of APBB1, a GAM2014 target gene which may modulate the internalization of beta- amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB1.The function of APBB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM2014 AVP GCTTCTCCTGTCCCC AVP (Accession NM_000490.2) is another GAM2014 target gene. AVP A A

TCCCTAC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of AVP. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM2014 A TCCCTAC BLMH GCTTCTCCTGTCCCC A Bleomycin Hydrolase (BLMH, Accession NM_000386.1) is another GAM2014 target gene. BLMH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BLMH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BLMH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of BLMH, a GAM2014 target gene which is a cysteine protease that inactivates bleomycin and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BLMH.The function of BLMH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM828.

GAM2014 A TCCCTAC DHCR24 GCTTCTCCTGTCCCC A 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is another GAM2014 target gene. DHCR24 BINDING SITE1 and DHCR24 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DHCR24, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE1 and DHCR24 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of DHCR24, a GAM2014 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2014 A TCCCTAC GLUL GCTTCTCCTGTCCCC A Glutamate- ammonia Ligase (glutamine synthase) (GLUL, Accession NM_002065.3) is another GAM2014 target gene. GLUL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLUL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GLUL BINDING SITE, and secondary structure

complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of GLUL, a GAM2014 target gene which catalyzes the condensation of glutamate and ammonia to form glutamine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GLUL.The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM519.

GAM2014 LRP1 GCTTCTCCTGTCCCC TCCCTAC A A Low Density Lipoprotein- related Protein 1 (alpha- 2- macroglobulin recep (LRP1, Accession NM_002332.1) is another GAM2014 target gene. LRP1 BINDING SITE1 and LRP1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by LRP1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of LRP1 BINDING SITE1 and LRP1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of LRP1, a GAM2014 target gene which is a recycling lipoprotein receptor with possible growth- modulating effects. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with LRP1.The function of LRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1975.

GAM2014 NCKAP1 GCTTCTCCTGTCCCC TCCCTAC A A NCKAP1 (Accession NM_013436.2) is another GAM2014 target gene. NCKAP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM2014 NGB GCTTCTCCTGTCCCC TCCCTAC A A Neuroglobin (NGB, Accession NM_021257.2) is another GAM2014 target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of NGB, a GAM2014 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2014 OGDH GCTTCTCCTGTCCCC Oxoglutarate Dehydrogenase (lipoamide) (OGDH, Accession A A

TCCCTAC NM_002541.1) is another GAM2014 target gene. OGDH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OGDH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OGDH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2014 is therefore inhibition of OGDH, a GAM2014 target gene which helps convert a- ketoglutarate to succinyl coenzyme A in Krebs cycle. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OGDH.The function of OGDH has been established by previous studies. In 3 males born to first-cousin Algerian parents and presenting with hypotonia, metabolic acidosis, and hyperlactatemia immediately after birth, Bonnefont et al. (1992) described a 'new' inborn error of the tricarboxylic acid cycle, alpha- ketoglutarate dehydrogenase deficiency. Neurologic deterioration resulted in death at about 30 months of age. Low molar ratios of ketone bodies in plasma of neonates with congenital lactic acidosis were proposed as an indicator of dysfunction of the tricarboxylic acid cycle. The parents of the 3 sibs were related as first cousins. Kohlschutter et al. (1982) reported a case of partial alpha- ketoglutarate dehydrogenase deficiency in 2 sibs of a consanguineous Tunisian family. In addition to genetic defects of the tricarboxylic acid cycle, other mechanisms for recessively inherited congenital lactic acidosis include inborn errors of pyruvate metabolism and inborn errors of oxidative phosphorylation. Guffon et al. (1993) described 2 new familial cases of 2-ketoglutarate dehydrogenase deficiency: a sister and brother born of consanguineous Portuguese parents. Axial hypotonia with no head control as late as age 4 years was described in both. Metabolic acidosis with acute episodes of acidotic decompensation and

sometimes hypoglycemia occurred during infections. The sister died suddenly after a general anesthesia. The alpha- ketoglutarate dehydrogenase complex is a multienzyme complex consisting of 3 protein subunits, alpha- ketoglutarate dehydrogenase (E1k, or oxoglutarate dehydrogenase; OGDH; EC 1.2.4.2), dihydrolipoyl succinyltransferase (E2k, or DLST; 126063), and dihydrolipoyl dehydrogenase (E3; 246900). The complex catalyzes a key reaction in the Krebs tricarboxylic acid cycle. The DLST gene maps to 14q24.3 and the E3 gene maps to chromosome 7. Koike et al. (1992) cloned the E1k gene, which codes for the alpha- ketoglutarate dehydrogenase subunit. Using 2 human/rodent somatic cell hybrid panels, Szabo et al. (1994) mapped the OGDH gene to 7p13- p11.2. A second related sequence, possibly a pseudogene, was identified and mapped to chromosome 10. Szabo et al. (1994) pointed to a possible significance to the finding of a reduction in the activity of this complex in Alzheimer disease brain and cultured skin fibroblasts from Alzheimer disease patients.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Guffon, N.; Lopez- Mediavilla, C.; Dumoulin, R.; Mousson, B.; Godinot, C.; Carrier, H.; Collombet, J. M.; Divry, P.; Mathieu, M.; Guibaud, P. : 2- Ketoglutarate dehydrogenase deficiency, a rare cause of primary hyperlactataemia: report of a new case. J. Inherit. Metab. Dis. 16: 821- 830, 1993. ; and

Szabo, P.; Cai, X.; Ali, G.; Blass, J. P. : Localization of the gene (OGDH) coding for the E1k component of the alpha- ketoglutarate dehydrogenase complex to chromosome 7p13- p11.2. Genomi.

Further studies establishing the function and utilities of OGDH are found in John Hopkins OMIM database record ID 203740, and in cited publications listed in Table 9, hereby incorporated herein.

GAM2014	PIN1	GCTTCTCCTGTCCCC TCCCTAC	Protein (peptidyl- prolyl cis/trans isomerase) NIMA- interacting 1 (PIN1, Accession NM_006221.1) is another GAM2014 target gene. PIN1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by PIN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PIN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2014 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM2014 is therefore inhibition of PIN1, a GAM2014 target gene which intervenes in cell cycle regulation. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2014 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated

with PIN1.The function of PIN1 has been established by previous studies. In the frog, Pin1 is implicated in the regulation of cell cycle progression and required for the DNA replication checkpoint. By fluorescence microscopy, Winkler et al. (2000) observed that nuclear extracts from Xenopus eggs depleted of Pin1 inappropriately transited from the G2 to the M phase of the cell cycle in the presence of a DNA replication inhibitor. Immunoblot analysis revealed that inappropriate transition was accompanied by hyperphosphorylation of CDC25 (see OMIM Ref. No. CDC25A, 116947), activation of CDC2 (OMIM Ref. No. 116940)/cyclin B (OMIM Ref. No. 123836), and mitotic phosphoproteins. Addition of recombinant wildtype, but not mutant, Pin1 reversed the defect in replication checkpoint function. Liou et al. (2002) demonstrated that loss of Pin1 function in mouse causes phenotypes resembling cyclin D1 (OMIM Ref. No. 168461) null phenotypes. Their findings confirmed that Pin1 positively regulates cyclin D1 function at the transcriptional level and also through posttranslational stabilization. The results provided genetic evidence for an essential role of Pin1 in maintaining cell proliferation and regulating cyclin D1 function

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Liou, Y.- C.; Ryo, A.; Huang, H.- K.; Lu, P.- J.; Bronson, R.; Fujimori, F.; Uchida, T.; Hunter, T.; Lu, K. P. : Loss of Pin1 function in the mouse causes phenotypes resembling cyclin D1- null phenotypes. Proc. Nat. Acad. Sci. 99: 1335- 1340, 2002. ; and

Lu, K. P.; Hanes, S. D.; Hunter, T. : A human peptidyl- prolyl isomerase essential for regulation of mitosis. Nature 380: 544- 547, 1996.

Further studies establishing the function and utilities of PIN1 are found in John Hopkins OMIM database record ID 601052, and in cited publications listed in Table 9, hereby incorporated herein.

GAM2022 ABCD1 GTTGGGTGTGAGGGG ABCD1 (Accession NM_000033.2) is a GAM2022 target gene. ABCD1 A A

GGTCCCA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ABCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ABCD1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2022 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2022 is therefore inhibition of ABCD1. Accordingly, utilities of GAM2022 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ABCD1.

GAM2022 MAPT GTTGGGTGTGAGGGG Microtubule- associated Protein Tau (MAPT, Accession A A

GGTCCCA NM_173727.1) is another GAM2022 target gene. MAPT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2022 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2022 is therefore inhibition of MAPT, a GAM2022 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2022 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM2027 BACE CATGGTACTGCCACA Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A

GAAGAGT is a GAM2027 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2027 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2027 is therefore inhibition of BACE, a GAM2027 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2027 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM2027 GSK3B CATGGTACTGCCACA Glycogen Synthase Kinase 3 Beta (GSK3B, Accession NM_002093.2) A A

GAAGAGT is another GAM2027 target gene. GSK3B BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by GSK3B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GSK3B BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2027 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2027 is therefore inhibition of GSK3B, a GAM2027 target gene which b subunit of glycogen synthase kinase 3 which phosphorylates regulatory proteins. and therefore is

associated with Alzheimer. Accordingly, utilities of GAM2027 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GSK3B.The function of GSK3B has been established by previous studies. Frame et al. (2001) demonstrated that the insulin- induced inhibition of GSK3 and its unique substrate specificity are explained by the existence of a phosphate- binding site in which arg96 is critical. Mutation of arg96 abolished the phosphorylation of 'primed' glycogen synthase as well as inhibition by protein kinase B (OMIM Ref. No. 605213)-mediated phosphorylation of ser9. Hence, the phosphorylated N terminus acts as a pseudosubstrate, occupying the same phosphate-binding site used by primed substrates. This mutation did not affect phosphorylation of 'nonprimed' substrates in the Wnt- signaling pathway (axin, 603816 and beta- catenin, 116806), suggesting novel approaches to design more selective GSK3 inhibitors for the treatment of diabetes. Animal model experiments lend further support to the function of GSK3B. Hoeflich et al. (2000) generated mice deficient in Gsk3b by targeted disruption. Although Gsk3b /- male and female mice were healthy and fertile, they did not give rise to live Gsk3b - /- progeny. Embryonic lethality occurred between embryonic days 13.5 and 14.5 due to severe liver degeneration, a phenotype consistent with excessive tumor necrosis factor (TNF; 191160) toxicity, as observed in mice lacking genes involved in the activation of transcription factor NFKB (see OMIM Ref. No. 164011). Gsk3b- deficient embryos were rescued by inhibition of TNF using anti- TNF- alpha antibody. Fibroblasts from Gsk3b- deficient embryos were hypersensitive to TNF- alpha and showed reduced NFKB function. Lithium treatment, which inhibits GSK3, sensitized wildtype fibroblasts to TNF and inhibited transactivation of NFKB. The early steps leading to NFKB activation were unaffected by the loss of Gsk3b, indicating that NFKB is regulated by GSK3B at the level of the transcriptional complex. Thus, GSK3B facilitates NFKB function. Ali et al. (2001) noted that loss of Gsk3b is not compensated by Gsk3a (OMIM Ref. No. 606784) and that NFKB activation is the only known differentiator between the 2 enzymes.

It is appreciated that the abovementioned animal model for GSK3B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Frame, S.; Cohen, P.; Biondi, R. M. : A common phosphate binding site explains the unique substrate specificity of GSK3 and its inactivation by phosphorylation. Molec. Cell 7: 1321- 1327, 2001. ; and

Hoeflich, K. P.; Luo, J.; Rubie, E. A.; Tsao, M.- S.; Jin, O.; Woodgett, J. R. : Requirement for glycogen synthase kinase- 3- beta in cell survival and NF- kappa- B activation. Nature 406: 8.

Further studies establishing the function and utilities of GSK3B are found in John Hopkins OMIM database record ID 605004, and in cited publications listed in Table 9, hereby incorporated herein.

GAM2027 HD CATGGTACTGCCACA HD (Accession NM_002111.3) is another GAM2027 target gene. HD A A

GAAGAGT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2027 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2027 is therefore inhibition of HD. Accordingly, utilities of GAM2027 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2027 IGF1 CATGGTACTGCCACA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

GAAGAGT NM_000618.2) is another GAM2027 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2027 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2027 is therefore inhibition of IGF1, a GAM2027 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2027 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2033 APLP2 TCAAGCTCATTCCTC Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession A A

TAACCTC NM_001642.1) is a GAM2033 target gene. APLP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2033 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2033 is therefore inhibition of APLP2, a

GAM2033 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2033 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM2033 HD TCAAGCTCATTCCTC HD (Accession NM_002111.3) is another GAM2033 target gene. HD A A

TAACCTC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2033 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2033 is therefore inhibition of HD. Accordingly, utilities of GAM2033 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2051 ACE GAACAGCTCCAGTCT Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A

ACAGCCC (ACE, Accession NM_152831.1) is a GAM2051 target gene. ACE BINDING SITE1 and ACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE1 and ACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2051 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2051 is therefore inhibition of ACE, a GAM2051 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM2051 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2051 DSCR1 GAACAGCTCCAGTCT Down Syndrome Critical Region Gene 1 (DSCR1, Accession A A

ACAGCCC NM_004414.3) is another GAM2051 target gene. DSCR1 BINDING SITE1 and DSCR1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DSCR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE1 and DSCR1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2051 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2051 is therefore inhibition of DSCR1, a GAM2051 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2051 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM2051 HD GAACAGCTCCAGTCT HD (Accession NM_002111.3) is another GAM2051 target gene. HD A A

ACAGCCC BINDING SITE1 and HD BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE1 and HD BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2051 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2051 is therefore inhibition of HD. Accordingly, utilities of GAM2051 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2051 PRNP GAACAGCTCCAGTCT Prion Protein (p27- 30) (Creutzfeld- Jakob disease, Gerstmann- A A

ACAGCCC Strausler- (PRNP, Accession NM_000311.1) is another GAM2051 target gene. PRNP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRNP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRNP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2051 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2051 is therefore inhibition of PRNP, a GAM2051 target gene which the function of prp is not known. prp is encoded in the host genome and is expressed both in normal and infected cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2051 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRNP.The function of PRNP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM2051 TNFSF5 GAACAGCTCCAGTCT TNFSF5 (Accession NM_000074.1) is another GAM2051 target gene. A A

ACAGCCC TNFSF5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFSF5 BINDING

SITE, and secondary structure complementarity to the nucleotide sequence of GAM2051 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2051 is therefore inhibition of TNFSF5. Accordingly, utilities of GAM2051 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFSF5.

GAM2058 ADAMTS5 TGAAAGAGATGTGGT A Disintegrin- like and Metalloprotease (reprolysin type) with A A

GTGTGAA Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM2058 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2058 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2058 is therefore inhibition of ADAMTS5, a GAM2058 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2058 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2058 MTNR1A TGAAAGAGATGTGGT Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is A A

GTGTGAA another GAM2058 target gene. MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MTNR1A, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2058 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2058 is therefore inhibition of MTNR1A, a GAM2058 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2058 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM2062 APPBP2 CCCAGGAGGCGGAGG Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A

TTGCAGT Protein 2 (APPBP2, Accession NM_006380.2) is a GAM2062 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2062 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2062 is therefore inhibition of APPBP2, a GAM2062 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2062 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2062 AVP CCCAGGAGGCGGAGG AVP (Accession NM_000490.2) is another GAM2062 target gene.
AVP A A

TTGCAGT BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2062 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2062 is therefore inhibition of AVP. Accordingly, utilities of GAM2062 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM2062 HTR2A CCCAGGAGGCGGAGG 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession
A A

TTGCAGT NM_000621.1) is another GAM2062 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2062 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2062 is therefore inhibition of HTR2A, a GAM2062 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2062 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM2062 IGF1 CCCAGGAGGCGGAGG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
TTGCAGT NM_000618.2) is another GAM2062 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2062 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2062 is therefore inhibition of IGF1, a GAM2062 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2062 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2062 PRND CCCAGGAGGCGGAGG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A
TTGCAGT another GAM2062 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2062 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2062 is therefore inhibition of PRND, a GAM2062 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2062 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2098 ACE TTGAGCACAGTTTGA Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A
GGAGTGT (ACE, Accession NM_152831.1) is a GAM2098 target gene. ACE BINDING SITE1 and ACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE1 and ACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2098 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2098 is therefore inhibition of ACE, a GAM2098 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with

Alzheimer. Accordingly, utilities of GAM2098 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2098 FPRL1 TTGAGCACAGTTTGA FPRL1 (Accession NM_001462.1) is another GAM2098 target gene. A A

GGAGTGT FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2098 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2098 is therefore inhibition of FPRL1. Accordingly, utilities of GAM2098 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM2098 IL1A TTGAGCACAGTTTGA Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another A A

GGAGTGT GAM2098 target gene. IL1A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2098 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2098 is therefore inhibition of IL1A, a GAM2098 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2098 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2098 PRND TTGAGCACAGTTTGA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

GGAGTGT another GAM2098 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2098 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2098 is therefore inhibition of PRND, a GAM2098 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2098 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2171 HD BINDING A A GGCAATATTCCAGGA TAGGCTG HD (Accession NM_002111.3) is a GAM2171 target gene. HD BINDING SITE1 and HD BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE1 and HD BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2171 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2171 is therefore inhibition of HD. Accordingly, utilities of GAM2171 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2171 HTR2C A A GGCAATATTCCAGGA TAGGCTG 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868.1) is another GAM2171 target gene. HTR2C BINDING SITE1 and HTR2C BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HTR2C, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE1 and HTR2C BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2171 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2171 is therefore inhibition of HTR2C, a GAM2171 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2171 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM2221 CTSK A A TCCAAAGACTCAACA GTTAGAC CTSK (Accession NM_000396.2) is a GAM2221 target gene. CTSK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSK BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2221 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2221 is therefore inhibition of CTSK. Accordingly, utilities of GAM2221 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSK.

GAM2223 A ATGTGGC A OGDH TCTTAGATTGAGAAG A Oxoglutarate Dehydrogenase (lipoamide) (OGDH, Accession NM_002541.1) is a GAM2223 target gene. OGDH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OGDH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OGDH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2223 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2223 is therefore inhibition of OGDH, a GAM2223 target gene which helps convert a- ketoglutarate to succinyl coenzyme A in Krebs cycle. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2223 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OGDH.The function of OGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM2014.

GAM2233 A TCTAAGA A HD GGACTGCAGTCACAC HD (Accession NM_002111.3) is a GAM2233 target gene. HD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2233 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2233 is therefore inhibition of HD. Accordingly, utilities of GAM2233 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2233 A TCTAAGA A PRND GGACTGCAGTCACAC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM2233 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2233 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2233 is therefore inhibition of PRND, a GAM2233 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities

of GAM2233 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2233 B A NGB GCCAGTG TCTTTCTACACCTCT Neuroglobin (NGB, Accession NM_021257.2) is another GAM2233 target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2233 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2233 is therefore inhibition of NGB, a GAM2233 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2233 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2233 A OGDH GCCAGTG TCTTTCTACACCTCT Oxoglutarate Dehydrogenase (lipoamide) (OGDH, Accession NM_002541.1) is another GAM2233 target gene. OGDH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OGDH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OGDH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2233 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B

Another function of GAM2233 is therefore inhibition of OGDH, a GAM2233 target gene which helps convert a- ketoglutarate to succinyl coenzyme A in Krebs cycle. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2233 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OGDH.The function of OGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM2014.

GAM2251 A DSCR1 AAATGGT GATTCCTCCTCTTTA Down Syndrome Critical Region Gene 1 (DSCR1, Accession NM_004414.3) is a GAM2251 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure A

complementarity to the nucleotide sequence of GAM2251 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2251 is therefore inhibition of DSCR1, a GAM2251 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2251 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM2251 IGF1 GATTCCTCCTCTTTA AAATGGT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM2251 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2251 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2251 is therefore inhibition of IGF1, a GAM2251 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2251 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2251 SNCA GATTCCTCCTCTTTA AAATGGT SNCA (Accession NM_000345.2) is another GAM2251 target gene. SNCA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2251 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2251 is therefore inhibition of SNCA. Accordingly, utilities of GAM2251 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM2251 TGFB1 GATTCCTCCTCTTTA AAATGGT TGFB1 (Accession NM_000660.1) is another GAM2251 target gene. TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING

SITE, and secondary structure complementarity to the nucleotide sequence of GAM2251 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2251 is therefore inhibition of TGFB1. Accordingly, utilities of GAM2251 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM2251 HD ACCCACCCTCTGTGA HD (Accession NM_002111.3) is another GAM2251 target gene. HD B A

GGAGGAT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2251 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2251 is therefore inhibition of HD. Accordingly, utilities of GAM2251 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2251 MAPK10 ACCCACCCTCTGTGA Mitogen- activated Protein Kinase 10 (MAPK10, Accession B A

GGAGGAT NM_138980.1) is another GAM2251 target gene. MAPK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2251 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2251 is therefore inhibition of MAPK10, a GAM2251 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2251 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM2260 APPBP2 GGGCATGATGATGGC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A

ACTAGCG Protein 2 (APPBP2, Accession NM_006380.2) is a GAM2260 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2260 RNA are set forth in Tables 6 and 7, hereby

incorporated herein.

A function of GAM2260 is therefore inhibition of APPBP2, a GAM2260 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2260 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2260 HTR2C GGGCATGATGATGGC 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession A A
ACTAGCG NM_000868.1) is another GAM2260 target gene. HTR2C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2260 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2260 is therefore inhibition of HTR2C, a GAM2260 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2260 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM2260 PRND GGGCATGATGATGGC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A
ACTAGCG another GAM2260 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2260 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2260 is therefore inhibition of PRND, a GAM2260 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2260 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2262 IGF1 TGAGGTAGGATGATT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

GCTAGCT NM_000618.2) is a GAM2262 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2262 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2262 is therefore inhibition of IGF1, a GAM2262 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2262 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2263 A HTR2C TTATCCTAAATGTGT TTTGAAG 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868.1) is a GAM2263 target gene. HTR2C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2263 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2263 is therefore inhibition of HTR2C, a GAM2263 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2263 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM2263 B PSEN1 AATTTAGAATCGTTT CTGATAG PSEN1 (Accession NM_000021.2) is another GAM2263 target gene. PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2263 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2263 is therefore inhibition of PSEN1. Accordingly, utilities of GAM2263 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM2270 ACT ATCACATTGCCAGTG Activator of CAMP- responsive Element Modulator (CR (ACT, A
A
ATTACCC Accession NM_020482.3) is a GAM2270 target gene. ACT BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ACT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2270 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2270 is therefore inhibition of ACT, a GAM2270 target gene which a plasma protease inhibitor synthesized in the liver. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2270 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACT.The function of ACT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1484.

GAM2270 APBA2 ATCACATTGCCAGTG Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A
A
ATTACCC 2 (X11- l (APBA2, Accession NM_005503.2) is another GAM2270 target gene. APBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2270 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2270 is therefore inhibition of APBA2, a GAM2270 target gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2270 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA2.The function of APBA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2270 DSCR1 ATCACATTGCCAGTG Down Syndrome Critical Region Gene 1 (DSCR1, Accession A
A
ATTACCC NM_004414.3) is another GAM2270 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2270 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2270 is therefore inhibition of

DSCR1, a GAM2270 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2270 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM2270 HD ATCACATTGCCAGTG HD (Accession NM_002111.3) is another GAM2270 target gene. HD A A

ATTACCC BINDING SITE1 and HD BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HD, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE1 and HD BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2270 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2270 is therefore inhibition of HD. Accordingly, utilities of GAM2270 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2270 PLAU ATCACATTGCCAGTG Plasminogen Activator, Urokinase (PLAU, Accession NM_002658.1) A A

ATTACCC is another GAM2270 target gene. PLAU BINDING SITE1 and PLAU BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PLAU, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PLAU BINDING SITE1 and PLAU BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2270 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2270 is therefore inhibition of PLAU, a GAM2270 target gene which is an urokinase plasminogen activator and serine protease . and therefore is associated with Alzheimer. Accordingly, utilities of GAM2270 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PLAU.The function of PLAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM282.

GAM2272 HD TCTGCTGTGATGGAC HD (Accession NM_002111.3) is a GAM2272 target gene. HD BINDING A A

ACTTGT SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2272 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2272 is therefore inhibition of HD. Accordingly, utilities of GAM2272 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2272 HTR2C TCTGCTGTGATGGAC 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession A A
ACTTGT NM_000868.1) is another GAM2272 target gene. HTR2C BINDING SITE1 and HTR2C BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by HTR2C, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE1 and HTR2C BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2272 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2272 is therefore inhibition of HTR2C, a GAM2272 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2272 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM2272 IGF1 TCTGCTGTGATGGAC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
ACTTGT NM_000618.2) is another GAM2272 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2272 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2272 is therefore inhibition of IGF1, a GAM2272 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2272 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2272 PSEN2 TCTGCTGTGATGGAC PSEN2 (Accession NM_012486.1) is another GAM2272 target gene. A A
ACTTGT PSEN2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PSEN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide

sequences of PSEN2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2272 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2272 is therefore inhibition of PSEN2. Accordingly, utilities of GAM2272 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN2.

GAM2272 TNFRSF6 TCTGCTGTGATGGAC TNFRSF6 (Accession NM_152877.1) is another GAM2272 target gene. A A
ACTTGT TNFRSF6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF6 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2272 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2272 is therefore inhibition of TNFRSF6. Accordingly, utilities of GAM2272 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF6.

GAM2290 GLUL TGTTATTTTGTCCAA Glutamate- ammonia Ligase (glutamine synthase) (GLUL, Accession A A
GAGAGAG NM_002065.3) is a GAM2290 target gene. GLUL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLUL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GLUL BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2290 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2290 is therefore inhibition of GLUL, a GAM2290 target gene which catalyzes the condensation of glutamate and ammonia to form glutamine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2290 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GLUL.The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM519.

GAM2290 IGF1 TGTTATTTTGTCCAA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
GAGAGAG NM_000618.2) is another GAM2290 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2290 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2290 is therefore inhibition of IGF1, a GAM2290 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2290 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2300 APBA2 TTAGCAGTTGTGAGA Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A
CCCTAGA 2 (X11- l (APBA2, Accession NM_005503.2) is a GAM2300 target gene. APBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2300 is therefore inhibition of APBA2, a GAM2300 target gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA2.The function of APBA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2300 PSEN1 TTAGCAGTTGTGAGA PSEN1 (Accession NM_000021.2) is another GAM2300 target gene. A A
CCCTAGA PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2300 is therefore inhibition of PSEN1. Accordingly, utilities of GAM2300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM2300 APPBP2 TTTGGGGTCTCCCCA Amyloid Beta Precursor Protein (cytoplasmic tail)- binding B A
GCATGCA Protein 2 (APPBP2, Accession NM_006380.2) is another GAM2300 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING

SITE, and secondary structure complementarity to the nucleotide sequence of GAM2300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2300 is therefore inhibition of APPBP2, a GAM2300 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2300 DSCR1 TTTGGGGTCTCCCCA Down Syndrome Critical Region Gene 1 (DSCR1, Accession B A

GCATGCA NM_004414.3) is another GAM2300 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2300 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2300 is therefore inhibition of DSCR1, a GAM2300 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2300 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM2306 ADAMTS5 TGGGTTAGTGGTTGA A Disintegrin- like and Metalloprotease (reprolysin type) with A A

ATAGTTT Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM2306 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2306 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2306 is therefore inhibition of ADAMTS5, a GAM2306 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2306 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2306 TNF TGGGTTAGTGGTTGA ATAGTTT Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, Accession NM_000594.2) is another GAM2306 target gene. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2306 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2306 is therefore inhibition of TNF, a GAM2306 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly, utilities of GAM2306 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNF.The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM2309 ACHE AGTTCCATGGAAAAC AACAAAG Acetylcholinesterase (YT blood group) (ACHE, Accession NM_015831.1) is a GAM2309 target gene. ACHE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACHE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACHE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2309 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2309 is therefore inhibition of ACHE, a GAM2309 target gene which rapidly hydrolyzes choline released into the synapse. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2309 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACHE.The function of ACHE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1191.

GAM2309 IAPP AGTTCCATGGAAAAC AACAAAG Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM2309 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2309 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2309 is therefore inhibition of

IAPP, a GAM2309 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM2309 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM2309 AVP CCCCACCCCAGTGGA AVP (Accession NM_000490.2) is another GAM2309 target gene. AVP B A

GCTCACC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2309 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2309 is therefore inhibition of AVP. Accordingly, utilities of GAM2309 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM2309 BACE2 CCCCACCCCAGTGGA Beta- site APP- cleaving Enzyme 2 (BACE2, Accession B A

GCTCACC NM_138992.1) is another GAM2309 target gene. BACE2 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2309 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2309 is therefore inhibition of BACE2, a GAM2309 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2309 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2309 MAPT CCCCACCCCAGTGGA Microtubule- associated Protein Tau (MAPT, Accession B A

GCTCACC NM_016835.1) is another GAM2309 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2309 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2309 is therefore inhibition of MAPT, a GAM2309 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2309 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM2309 B A MPO CCCCACCCCAGTGGAGCTCACC Myeloperoxidase (MPO, Accession NM_000250.1) is another target gene. MPO BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2309 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2309 is therefore inhibition of MPO, a GAM2309 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2309 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM2350 A A AGER CCTGCCCATCCTGCCTCCACCA Advanced Glycosylation End Product- specific Receptor (AGER, Accession NM_172197.1) is a GAM2350 target gene. AGER BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by AGER, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AGER BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2350 is therefore inhibition of AGER, a GAM2350 target gene which Receptor for advanced glycosylation end products (receptor for AGE). and therefore is associated with Alzheimer. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AGER.The function of AGER has been established by previous studies. Sugaya et al. (1994) identified 3 genes located 90 to 140 kb centromeric to the tenascin-like gene (OMIM Ref. No. 600261) in the MHC class III region near the junction with class II. One of these was the gene for receptor

of advanced glycosylation end products of proteins, a member of the immunoglobulin superfamily. A second was the PBX2 homeo box gene (OMIM Ref. No. 176311), and a third was the human counterpart of the mouse mammary tumor gene int- 3 (OMIM Ref. No. 164951). The PBX2 and AGER genes are immediately contiguous and are transcribed in the same direction. In addition to mapping by contiguous cosmids and YAC clones, Sugaya et al. (1994) determined the location of the AGER sequence on 6p21.3 by fluorescence in situ hybridization. The receptor for advanced glycation end products (RAGE), a multiligand member of the immunoglobulin superfamily of cell surface molecules, interacts with distinct molecules implicated in homeostasis, development, and inflammation, and certain diseases such as diabetes (see OMIM Ref. No. 125853, 222100) and Alzheimer disease. Engagement of RAGE by a ligand triggers activation of key cell signaling pathways, such as p21(ras) (see OMIM Ref. No. 139150), MAP kinases (see OMIM Ref. No. 176948), NF- kappa- B (see OMIM Ref. No. 164011), and cdc42 (OMIM Ref. No. 602590)/rac (OMIM Ref. No. 602048), thereby reprogramming cellular properties. RAGE is a central cell surface receptor for amphoterin (HMG1; 163905), a polypeptide linked to outgrowth of cultured cortical neurons derived from developing brain. Indeed, the colocalization of RAGE and amphoterin at the leading edge of advancing neurites indicated their potential contribution to cellular migration, and in pathologies such as tumor invasion. Taguchi et al. (2000) demonstrated that blockade of RAGE-amphoterin decreased growth and metastases of both implanted tumors and tumors developing spontaneously in susceptible mice. Inhibition of the RAGE- amphoterin interaction suppressed activation of p44 (OMIM Ref. No. 601795)/p42 (OMIM Ref. No. 603441), p38 (OMIM Ref. No. 600289), and SAP/JNK (OMIM Ref. No. 601158) MAP kinases, molecular effector mechanisms importantly linked to tumor proliferation, invasion, and expression of matrix metalloproteinases.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Sugaya, K.; Fukagawa, T.; Matsumoto, K.; Mita, K.; Takahashi, E.; Ando, A.; Inoko, H.; Ikemura, T. : Three genes in the human MHC class III region near the junction with the class II: gene for receptor of advanced glycosylation end products, PBX2 homeobox gene and a Notch homolog, human counterpart of mouse mammary tumor gene int- 3. Genomics 23: 408- 419, 1994. ; and

Taguchi, A.; Blood, D. C.; del Toro, G.; Canet, A.; Lee, D. C.; Qu, W.; Tanji, N.; Lu, Y.; Lalla, E.; Fu, C.; Hofmann, M. A.; Kislinger, T.; Ingram, M.; Lu, A.; Tanaka, H.; Hori, O.; Oga.

Further studies establishing the function and utilities of AGER are found in John Hopkins OMIM database record ID 600214, and in

cited publications listed in Table 9, hereby incorporated herein.

GAM2350 APBA1 CCTGCCCATCCTGCC Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A
TCCACCA 1 (X11) (APBA1, Accession NM_001163.2) is another GAM2350 target gene. APBA1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APBA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of APBA1, a GAM2350 target gene which stabilises APP and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA1.The function of APBA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM2350 MAPT CCTGCCCATCCTGCC Microtubule- associated Protein Tau (MAPT, Accession A A
TCCACCA NM_173727.1) is another GAM2350 target gene. MAPT BINDING SITE1 and MAPT BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by MAPT, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE1 and MAPT BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of MAPT, a GAM2350 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM2350 PSEN1 CCTGCCCATCCTGCC PSEN1 (Accession NM_007318.1) is another GAM2350 target gene. A A
TCCACCA PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PSEN1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of PSEN1. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM2350 A TFCP2 A CCTGCCCATCCTGCC TCCACCA Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is another GAM2350 target gene. TFCP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TFCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of TFCP2, a GAM2350 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM760.

GAM2350 A TGFB1 A CCTGCCCATCCTGCC TCCACCA TGFB1 (Accession NM_000660.1) is another GAM2350 target gene. TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of TGFB1. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM2350 B DSCR1 A CCTGGGGGCCACTTT GCACAGG Down Syndrome Critical Region Gene 1 (DSCR1, Accession NM_004414.3) is another GAM2350 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of DSCR1, a GAM2350 target gene which inhibits calcineurin- dependent

transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM2350 NOTCH1 CCTGGGGGCCACTTT Notch (Drosophila) Homolog 1 (translocation- associated) B A

GCACAGG (NOTCH1, Accession NM_017617.2) is another GAM2350 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of NOTCH1, a GAM2350 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM2350 SERPINA CCTGGGGGCCACTTT Serine (or cysteine) Proteinase Inhibitor, Clade A (alpha- 1 B A 3 GCACAGG antiprotei (SERPINA3, Accession NM_001085.2) is another GAM2350 target gene. SERPINA3 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SERPINA3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SERPINA3 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2350 is therefore inhibition of SERPINA3, a GAM2350 target gene which is a member of the serpin family of serine protease inhibitors. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SERPINA3.The function of SERPINA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM2384 APBB2 AATCTTCACTAAAAT Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

GGACAAG 2 (Fe65- (APBB2, Accession NM_173075.1) is a GAM2384 target gene. APBB2 BINDING SITE is a target binding site found in the 3`

untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2384 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2384 is therefore inhibition of APBB2, a GAM2384 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2384 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2384 APBB2 CGTGTTCAGTATGGT Amyloid Beta (A4) Precursor Protein- binding, Family B, Member B A

GGGAGAT 2 (Fe65- (APBB2, Accession NM_173075.1) is another GAM2384 target gene. APBB2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2384 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2384 is therefore inhibition of APBB2, a GAM2384 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2384 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2391 APBA2 TTAGCAGTTGTGAGA Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A

CCCTAGA 2 (X11- l (APBA2, Accession NM_005503.2) is a GAM2391 target gene. APBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2391 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2391 is therefore inhibition of APBA2, a GAM2391 target gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits

production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2391 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA2.The function of APBA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2391 PSEN1 TTAGCAGTTGTGAGA PSEN1 (Accession NM_000021.2) is another GAM2391 target gene. A A

CCCTAGA PSEN1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2391 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2391 is therefore inhibition of PSEN1. Accordingly, utilities of GAM2391 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM2391 APPBP2 TTTGGGGTCTCCCCA Amyloid Beta Precursor Protein (cytoplasmic tail)- binding B A

GCATGCA Protein 2 (APPBP2, Accession NM_006380.2) is another GAM2391 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2391 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2391 is therefore inhibition of APPBP2, a GAM2391 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2391 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2391 DSCR1 TTTGGGGTCTCCCCA Down Syndrome Critical Region Gene 1 (DSCR1, Accession B A

GCATGCA NM_004414.3) is another GAM2391 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2391 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2391 is therefore inhibition of DSCR1, a GAM2391 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2391 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM2393 APPBP2 AATGAAGCCACAGAG ATTTGCT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM2393 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2393 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2393 is therefore inhibition of APPBP2, a GAM2393 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2393 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2393 HD AATGAAGCCACAGAG ATTTGCT HD (Accession NM_002111.3) is another GAM2393 target gene. HD BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2393 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2393 is therefore inhibition of HD. Accordingly, utilities of GAM2393 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM2398 TNFRSF6 ATCTAGAGAGGCAGT CTGGCCA TNFRSF6 (Accession NM_152875.1) is a GAM2398 target gene. TNFRSF6 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by TNFRSF6, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFRSF6 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2398 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2398 is therefore inhibition of TNFRSF6. Accordingly, utilities of GAM2398 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF6.

GAM2398 APLP1 CTGCTGCCTTTCTCT CAGAGAT Amyloid Beta (A4) Precursor- like Protein 1 (APLP1, Accession NM_005166.2) is another GAM2398 target gene. APLP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2398 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM2398 is therefore inhibition of APLP1, a GAM2398 target gene which is a membrane- associated glycoprotein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2398 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP1.The function of APLP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM282.

GAM2398 CHAT CTGCTGCCTTTCTCT CAGAGAT Choline Acetyltransferase (CHAT, Accession NM_020986.1) is another GAM2398 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2398 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM2398 is therefore inhibition of CHAT, a GAM2398 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2398 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM2398 FLNB CTGCTGCCTTTCTCT CAGAGAT Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is another GAM2398 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2398 RNA are set B A

forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2398 is therefore inhibition of FLNB, a GAM2398 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2398 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM2424 APPBP2 ACTGCACTCCAGCCT GGGCAAC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM2424 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2424 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2424 is therefore inhibition of APPBP2, a GAM2424 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2424 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2424 BACE2 ACTGCACTCCAGCCT GGGCAAC Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_012105.3) is another GAM2424 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2424 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2424 is therefore inhibition of BACE2, a GAM2424 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2424 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2424 FHL2 ACTGCACTCCAGCCT Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

GGGCAAC another GAM2424 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2424 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2424 is therefore inhibition of FHL2, a GAM2424 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2424 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2424 IGF1 ACTGCACTCCAGCCT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

GGGCAAC NM_000618.2) is another GAM2424 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2424 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2424 is therefore inhibition of IGF1, a GAM2424 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2424 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2424 MME ACTGCACTCCAGCCT Membrane Metallo- endopeptidase (neutral endopeptidase, A A

GGGCAAC enkephalinase, (MME, Accession NM_000902.2) is another GAM2424 target gene. MME BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2424 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2424 is therefore inhibition of MME, a GAM2424 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2424 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2424 PRND ACTGCACTCCAGCCT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

GGGCAAC another GAM2424 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM2424 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2424 is therefore inhibition of PRND, a GAM2424 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2424 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2440 FHL2 ACTGCACTCCAGCCT Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

GGGTGAC a GAM2440 target gene. FHL2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2440 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2440 is therefore inhibition of FHL2, a GAM2440 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2440 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2440 IGF1 ACTGCACTCCAGCCT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

GGGTGAC NM_000618.2) is another GAM2440 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA

encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2440 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2440 is therefore inhibition of IGF1, a GAM2440 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2440 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2440 PRND ACTGCACTCCAGCCT AA GGGTGAC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM2440 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2440 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2440 is therefore inhibition of PRND, a GAM2440 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2440 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2514 CTSG CTGTCCTGTGTCAGC AA CTGAAAT Cathepsin G (CTSG, Accession NM_001911.2) is a GAM2514 target gene. CTSG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSG BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2514 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2514 is therefore inhibition of CTSG, a GAM2514 target gene which is a member of the peptidase S1 protein family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2514 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSG.The function of CTSG has been established by previous

studies. Neutrophilic polymorphonuclear leukocytes contain specialized azurophil granules whose contents, including the serine proteases cathepsin G and elastase, may participate in the killing and digestion of engulfed pathogens, and in connective tissue remodeling at sites of inflammation. Cathepsin G is a 26,000- Da protease. Using mRNA from a leukemic cell line, Salvesen et al. (1987) isolated and determined the sequence of a cDNA clone encoding CTSG Since one form of Alzheimer disease, AD3, maps to 14q24.3, the lysosomal serine protease cathepsin G, which also maps to 14q, is a candidate for the site of the mutation. A defect in the cellular processing of amyloid precursor protein in familial Alzheimer disease has been postulated. Wong et al. (1993) analyzed the nucleotide sequence of the entire open reading frame of the CTSG gene and found no abnormality in 1 clinically affected member from each of 5 large FAD pedigrees that showed significant or nearly significant lod scores with one or more markers on chromosome 14. The sequence was compared with that of his/her unaffected living parent in each case and no differences were found Animal model experiments lend further support to the function of CTSG. Using mice deficient in Ctsg and/or Ela2 (OMIM Ref. No. 130130), Reeves et al. (2002) confirmed data originally generated by Tkalcevic et al. (2000) and Belaaouaj et al. (1998) that Ctsg - /- mice resist Candida but not Staphylococcal infection, whereas the reverse is true in Ela2 - /- mice. Both organisms were more virulent in double-knockout mice. Purified neutrophils from these mice mirrored these results in vitro in spite of exhibiting normal phagocytosis, degranulation, oxidase activity, superoxide production, and myeloperoxidase (MPO; 606989) activity. Reeves et al. (2002) hypothesized that reactive oxygen species (ROS) and proteases act together since deficiencies in either lead to comparable reductions in killing efficiency. They determined that conditions in the phagocytic vacuole after activation provoke the influx of enormous concentrations of ROS compensated by a surge of K ions crossing the membrane in a pH- dependent manner. The resulting rise in ionic strength induces the release of cationic granule proteins, including Ctsg and Ela2, from the highly charged anionic sulfated proteoglycan matrix within the granules. Reeves et al. (2002) concluded that it is essential for the volume of the vacuole to be restricted for the requisite hypertonicity to develop. They proposed that disruption of the integrity of the cytoskeletal network by microbial products could offer a mechanism of virulence by inhibiting the activation of granule proteins. They also suggested that a role of MPO may be to protect proteases, notably CTSG, from oxidative damage. In a commentary, Gratzer (2002) noted that mycobacteria may evade the innate immune response by their ability to disrupt actin filaments as demonstrated by Guerin and de Chastellier (2000).

It is appreciated that the abovementioned animal model for CTSG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the

publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Salvesen, G.; Farley, D.; Shuman, J.; Przybyla, A.; Reilly, C.; Travis, J. : Molecular cloning of human cathepsin G: structural similarity to mast cell and cytotoxic T lymphocyte proteinases. Biochemistry 26: 2289- 2293, 1987. ; and

Reeves, E. P.; Lu, H.; Jacobs, H. L.; Messina, C. G. M.; Bolsover, S.; Gabella, G.; Potma, E. O.; Warley, A.; Roes, J.; Segal, A. W. : Killing activity of neutrophils is mediated through.

Further studies establishing the function and utilities of CTSG are found in John Hopkins OMIM database record ID 116830, and in cited publications listed in Table 9, hereby incorporated herein.

GAM2514 ADAM10 GTTTTAGGCAACATA A Disintegrin and Metalloproteinase Domain 10 (ADAM10, B A

GGAAGAC Accession NM_001110.1) is another GAM2514 target gene. ADAM10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2514 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2514 is therefore inhibition of ADAM10, a GAM2514 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2514 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM10.The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1300.

GAM2514 HD GTTTTAGGCAACATA HD (Accession NM_002111.3) is another GAM2514 target gene. HD B A

GGAAGAC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2514 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2514 is therefore inhibition of HD. Accordingly, utilities of GAM2514 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical

conditions associated with HD.

GAM2519 ACE ACTGCAGCTTCAGGG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A ACTTGTG (ACE, Accession NM_152831.1) is a GAM2519 target gene. ACE BINDING SITE1 and ACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE1 and ACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2519 is therefore inhibition of ACE, a GAM2519 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM2519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2519 AVP ACTGCAGCTTCAGGG AVP (Accession NM_000490.2) is another GAM2519 target gene. AVP A A ACTTGTG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2519 is therefore inhibition of AVP. Accordingly, utilities of GAM2519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM2519 CTNND2 ACTGCAGCTTCAGGG Catenin (cadherin- associated protein), Delta 2 (neural A A ACTTGTG plakophilin- rel (CTNND2, Accession NM_001332.1) is another GAM2519 target gene. CTNND2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by CTNND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTNND2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2519 is therefore inhibition of CTNND2, a GAM2519 target gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTNND2.The function of CTNND2 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM2519 DHCR24 ACTGCAGCTTCAGGG ACTTGTG A A — 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is another GAM2519 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2519 is therefore inhibition of DHCR24, a GAM2519 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2519 IAPP ACTGCAGCTTCAGGG ACTTGTG A A — Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM2519 target gene. IAPP BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2519 is therefore inhibition of IAPP, a GAM2519 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM2519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM2519 PSEN2 ACTGCAGCTTCAGGG ACTTGTG A A — PSEN2 (Accession NM_000447.1) is another GAM2519 target gene. PSEN2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by PSEN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2519 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2519 is therefore inhibition of PSEN2. Accordingly, utilities of GAM2519 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN2.

GAM2543 BACE TTAATGCTAATCGTG Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A

ATAGGGG is a GAM2543 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2543 is therefore inhibition of BACE, a GAM2543 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM2543 FPRL1 TTAATGCTAATCGTG FPRL1 (Accession NM_001462.1) is another GAM2543 target gene. A A

ATAGGGG FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2543 is therefore inhibition of FPRL1. Accordingly, utilities of GAM2543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM2543 SLC6A4 TTAATGCTAATCGTG Solute Carrier Family 6 (neurotransmitter transporter, A A

ATAGGGG serotonin), Mem (SLC6A4, Accession NM_001045.1) is another GAM2543 target gene. SLC6A4 BINDING SITE1 and SLC6A4 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by SLC6A4, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC6A4 BINDING SITE1 and SLC6A4 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2543 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2543 is therefore inhibition of SLC6A4, a GAM2543 target gene which terminates the action of

serotonine by its high affinity sodium- dependent reuptake into presynaptic terminals. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2543 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC6A4.The function of SLC6A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1294.

GAM2565 IGF1 ATGACACAGTGGGGC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A
CAGTTGG NM_000618.2) is a GAM2565 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2565 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2565 is therefore inhibition of IGF1, a GAM2565 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2565 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2565 MAPT ATGACACAGTGGGGC Microtubule- associated Protein Tau (MAPT, Accession A A
CAGTTGG NM_173727.1) is another GAM2565 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2565 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2565 is therefore inhibition of MAPT, a GAM2565 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2565 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM2591 NGB ACCACAGTGTCACAG Neuroglobin (NGB, Accession NM_021257.2) is a GAM2591 target A A
AGTCCAT gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a

target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2591 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2591 is therefore inhibition of NGB, a GAM2591 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2591 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2608 BACE TAAGGTGCATCTAGT Beta- site APP- cleaving Enzyme (BACE, Accession NM_138973.1) A A GCAGTTA is a GAM2608 target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2608 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2608 is therefore inhibition of BACE, a GAM2608 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2608 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM2608 CASP3 TAAGGTGCATCTAGT Caspase 3, Apoptosis- related Cysteine Protease (CASP3, A A GCAGTTA Accession NM_032991.1) is another GAM2608 target gene. CASP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CASP3 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2608 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2608 is therefore inhibition of CASP3, a GAM2608 target gene which is one apoptosis- related cysteine protease and is important for the initiation of apoptotic cell death. and therefore is associated with Alzheimer. Accordingly,

utilities of GAM2608 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CASP3.The function of CASP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM801.

GAM2618 ADAM17 TGGGAAGATGCTGGC A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A

AAGGTGC factor, (ADAM17, Accession NM_021832.1) is a GAM2618 target gene. ADAM17 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2618 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2618 is therefore inhibition of ADAM17, a GAM2618 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2618 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM2618 AGER TGGGAAGATGCTGGC Advanced Glycosylation End Product- specific Receptor (AGER, A A

AAGGTGC Accession NM_172197.1) is another GAM2618 target gene. AGER BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by AGER, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AGER BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2618 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2618 is therefore inhibition of AGER, a GAM2618 target gene which Receptor for advanced glycosylation end products (receptor for AGE). and therefore is associated with Alzheimer. Accordingly, utilities of GAM2618 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AGER.The function of AGER and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM2350.

GAM2618 IGF1 TGGGAAGATGCTGGC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

AAGGTGC NM_000618.2) is another GAM2618 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2618 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2618 is therefore inhibition of IGF1, a GAM2618 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2618 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2618 PSEN1 TGGGAAGATGCTGGC PSEN1 (Accession NM_007319.1) is another GAM2618 target gene. A A
AAGGTGC PSEN1 BINDING SITE1 through PSEN1 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PSEN1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE1 through PSEN1 BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM2618 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2618 is therefore inhibition of PSEN1. Accordingly, utilities of GAM2618 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM2624 ACT TCTGAGCCCAGGAGT Activator of CAMP- responsive Element Modulator (CR (ACT, A A
TTGAGGC Accession NM_020482.3) is a GAM2624 target gene. ACT BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ACT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2624 is therefore inhibition of ACT, a GAM2624 target gene which a plasma protease inhibitor synthesized in the liver. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACT.The function of ACT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1484.

GAM2624 CTNND2 TCTGAGCCCAGGAGT Catenin (cadherin- associated protein), Delta 2 (neural A A
TTGAGGC plakophilin- rel (CTNND2, Accession NM_001332.1) is another GAM2624 target gene. CTNND2 BINDING SITE is a target binding site found in

the 3` untranslated region of mRNA encoded by CTNND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTNND2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of CTNND2, a GAM2624 target gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTNND2.The function of CTNND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM2624 DLST TCTGAGCCCAGGAGT TTGAGGC Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM2624 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2624 is therefore inhibition of DLST, a GAM2624 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM2624 GFAP TCTGAGCCCAGGAGT TTGAGGC GFAP (Accession NM_002055.2) is another GAM2624 target gene. GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2624 is therefore inhibition of GFAP. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM2624 IGF1 TCTGAGCCCAGGAGT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

TTGAGGC NM_000618.2) is another GAM2624 target gene. IGF1 BINDING SITE1 and IGF1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IGF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE1 and IGF1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of IGF1, a GAM2624 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2624 OGDH TCTGAGCCCAGGAGT Oxoglutarate Dehydrogenase (lipoamide) (OGDH, Accession A A

TTGAGGC NM_002541.1) is another GAM2624 target gene. OGDH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OGDH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OGDH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of OGDH, a GAM2624 target gene which helps convert a- ketoglutarate to succinyl coenzyme A in Krebs cycle. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OGDH.The function of OGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM2014.

GAM2624 PRND TCTGAGCCCAGGAGT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

TTGAGGC another GAM2624 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of PRND, a GAM2624 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2624 TFCP2 TCTGAGCCCAGGAGT Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is A A
TTGAGGC another GAM2624 target gene. TFCP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TFCP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of TFCP2, a GAM2624 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM760.

GAM2624 APPBP2 GCACTCAAGCCTGGG Amyloid Beta Precursor Protein (cytoplasmic tail)- binding B A
TTACAGA Protein 2 (APPBP2, Accession NM_006380.2) is another GAM2624 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of APPBP2, a GAM2624 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2624 FHL2 GCACTCAAGCCTGGG Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is B A
TTACAGA another GAM2624 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA

encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of FHL2, a GAM2624 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2624 IGF1 GCACTCAAGCCTGGG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession B A
TTACAGA NM_000618.2) is another GAM2624 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of IGF1, a GAM2624 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2624 PRND GCACTCAAGCCTGGG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is B A
TTACAGA another GAM2624 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM2624 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2624 is therefore inhibition of PRND, a GAM2624 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2624 include diagnosis, prevention and treatment of Alzheimer,

and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2628 DHCR24 TCCCTTTGAAGCCAG A A GTTCCAG 24- dehydrocholesterol Reductase (DHCR24, Accession NM_014762.1) is a GAM2628 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2628 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2628 is therefore inhibition of DHCR24, a GAM2628 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2628 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2628 TGFB1 TCCCTTTGAAGCCAG A A GTTCCAG TGFB1 (Accession NM_000660.1) is another GAM2628 target gene. TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2628 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2628 is therefore inhibition of TGFB1. Accordingly, utilities of GAM2628 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM2631 PSEN1 TTGGTGCAAATGGCA A A TTTCCAT PSEN1 (Accession NM_007318.1) is a GAM2631 target gene. PSEN1 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PSEN1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2631 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2631 is therefore inhibition of PSEN1. Accordingly, utilities of GAM2631 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical

conditions associated with PSEN1.

GAM2640 APPBP2 ATGCCTGTAATCCCA GCATTTT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM2640 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2640 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2640 is therefore inhibition of APPBP2, a GAM2640 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2640 IGF1 ATGCCTGTAATCCCA GCATTTT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM2640 target gene. IGF1 BINDING SITE1 and IGF1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IGF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE1 and IGF1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2640 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2640 is therefore inhibition of IGF1, a GAM2640 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2640 PRND ATGCCTGTAATCCCA GCATTTT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM2640 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2640 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2640 is therefore inhibition of PRND, a GAM2640 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2672 FLNB TGTGACACGTTCATT CTGCAAG Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is a GAM2672 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2672 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2672 is therefore inhibition of FLNB, a GAM2672 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2672 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM2732 ADAMTS5 ATCACTTTGCAGGGA TTACTAA A Disintegrin- like and Metalloprotease (reprolysin type) with Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM2732 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2732 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2732 is therefore inhibition of ADAMTS5, a GAM2732 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2732 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2732 APBB1 ATCACTTTGCAGGGA TTACTAA Amyloid Beta (A4) Precursor Protein- binding, Family B, Member 1 (Fe65) (APBB1, Accession NM_145689.1) is another GAM2732 target gene. APBB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by A A

APBB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2732 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2732 is therefore inhibition of APBB1, a GAM2732 target gene which may modulate the internalization of beta- amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2732 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB1.The function of APBB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM2762 BLMH CACACAGTCGTGTAG Bleomycin Hydrolase (BLMH, Accession NM_000386.1) is a
GAM2762 A A
TTTTGCG target gene. BLMH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by BLMH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BLMH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2762 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2762 is therefore inhibition of BLMH, a GAM2762 target gene which is a cysteine protease that inactivates bleomycin and therefore is associated with Alzheimer. Accordingly, utilities of GAM2762 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BLMH.The function of BLMH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM828.

GAM2762 CTNND2 CACACAGTCGTGTAG Catenin (cadherin- associated protein), Delta 2 (neural A A
TTTTGCG plakophilin- rel (CTNND2, Accession NM_001332.1) is another GAM2762 target gene. CTNND2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTNND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTNND2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2762 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2762 is therefore inhibition of CTNND2, a GAM2762 target gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2762 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTNND2.The function of CTNND2 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM2762 IGF1 CACACAGTCGTGTAG TTTTGCG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM2762 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2762 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2762 is therefore inhibition of IGF1, a GAM2762 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2762 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2770 CASP3 CTGGCTAATTTTCTT GAGTTTT Caspase 3, Apoptosis- related Cysteine Protease (CASP3, Accession NM_004346.2) is a GAM2770 target gene. CASP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CASP3 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2770 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2770 is therefore inhibition of CASP3, a GAM2770 target gene which is one apoptosis- related cysteine protease and is important for the initiation of apoptotic cell death. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CASP3.The function of CASP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM801.

GAM2770 HTR2C CTGGCTAATTTTCTT GAGTTTT 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868.1) is another GAM2770 target gene. HTR2C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2770 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2770 is therefore inhibition of HTR2C, a GAM2770 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM2770	IDE	CTGGCTAATTTTCTT GAGTTTT	Insulin- degrading Enzyme (IDE, Accession NM_004969.1) is another GAM2770 target gene. IDE BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IDE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IDE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM2770 is therefore inhibition of IDE, a GAM2770 target gene which may play a role in the cellular processing of insulin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IDE.The function of IDE has been established by previous studies. Insulin- degrading enzyme (EC 3.4.24.56), also known as insulysin, is a 110- kD neutral metallopeptidase that can degrade a number of peptides, including insulin (OMIM Ref. No. 176730) and beta- amyloid (OMIM Ref. No. 104760). Affholter et al. (1988) isolated and sequenced a cDNA coding for IDE. The deduced amino acid sequence of the enzyme contained the sequences of 13 peptides derived from the isolated protein. The cDNA transcribed in vitro yielded a synthetic RNA that in cell- free translations produced a protein that coelectrophoresed with the native proteinase and could be immunoprecipitated with monoclonal antibodies to IDE. Since the deduced sequence of this proteinase did not contain the consensus sequences for any of the known classes of proteinases (i.e. metallo, cysteine, aspartic, or serine), it may be a member of a family of proteases that are involved in intercellular peptide signaling. It did show homology to an Escherichia coli proteinase (called protease III), which also cleaves insulin and is present in the periplasmic space; thus, they may be members of the same family of proteases. et al. (1998) determined that the extracellular thiol metalloprotease capable of degrading amyloid- beta protein identified by Qiu et al. (1997) is the same as IDE. By Western blot analysis, they found a full- length 110- kD IDE band in the CSF of normal individuals and of patients with Alzheimer disease or non- Alzheimer dementia. They found no difference in IDE levels of the normal and patient populations. By biochemical analysis of IDE purified from the medium of a mouse microglial cell line, they determined that IDE could degrade both

endogenous and synthetic amyloid- beta protein and that it could catalyze the oligomerization of this protein. Through a series of inhibitor studies, in vitro translation, and biochemical assays of rat IDE expressed by transfected human kidney cells, Edbauer et al. (2002) determined that IDE may be the protease responsible for the clearance of the cytoplasmic fragment of the amyloid- beta precursor protein (APP) following liberation of the amyloid- beta protein. Affholter et al. (1990) mapped the IDE gene to human chromosome 10 and mouse chromosome 19 by hybridization of cDNA probes to human-rodent or mouse- hamster somatic cell hybrids, respectively. By a combination of somatic cell hybrid analysis and in situ hybridization, Espinosa et al. (1991) localized the IDE gene to 10q23- q25. The mapping of the IDE gene to chromosome 10q23- q25 made it a candidate gene for the Alzheimer disease- 6 locus (AD6; 605526). Abraham et al. (2001) analyzed all of the coding exons, untranslated regions, and 1,000 bp of 5- prime flanking sequence of IDE by means of denaturing HPLC and sequencing. They detected 8 single nucleotide polymorphisms (SNPs), of which 3 were found at lower than 5% frequency. None of them changed the amino acid sequence. Abraham et al. (2001) found no significant association between any individual SNP and late- onset AD or with any haplotypes. They concluded that IDE does not make a substantial contribution to the etiology of late- onset AD and therefore cannot account for the linkage between late- onset AD and 10q. Animal model experiments lend further support to the function of IDE. Genetic analysis of the diabetic GK rat has revealed several diabetes susceptibility loci (see OMIM Ref. No. 125853). Fakhrai- Rad et al. (2000) mapped one such locus, NIDDM1B, to a 1- cM region by genetic and pathophysiologic characterization of new congenic substrains for the locus. The IDE gene was also mapped to this 1- cM region, and 2 amino acid substitutions (H18R and A890V) were identified in the GK allele which reduced insulin- degrading activity by 31% in transfected cells. However, when the H18R and A890V variants were studied separately, no effects were observed, suggesting a synergistic effect of the 2 variants on insulin degradation. No effect on insulin degradation was observed in cell lysates, suggesting that the effect may be coupled to receptor- mediated internalization of insulin. Congenic rats with the IDE GK allele displayed postprandial hyperglycemia, reduced lipogenesis in fat cells, blunted insulin- stimulated glucose transmembrane uptake, and reduced insulin degradation in isolated muscle. Analysis of additional rat strains demonstrated that the dysfunctional IDE allele was unique to GK rats. The authors concluded that IDE plays an important role in the diabetic phenotype in GK rats.

It is appreciated that the abovementioned animal model for IDE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Fakhrai- Rad, H.; Nikoshkov, A.; Kamel, A.; Fernstrom, M.; Zierath, J. R.; Norgren, S.; Luthman, H.; Galli, J. : Insulin-degrading enzyme identified as a candidate diabetes susceptibility gene in GK rats. Hum. Molec. Genet. 9: 2149- 2158, 2000. ; and

Edbauer, D.; Willem, M.; Lammich, S.; Steiner, H.; Haass, C. : Insulin- degrading enzyme rapidly removes the beta- amyloid precursor protein intracellular domain (AICD). J. Biol. Chem. 27.

Further studies establishing the function and utilities of IDE are found in John Hopkins OMIM database record ID 146680, and in cited publications listed in Table 9, hereby incorporated herein.

GAM2770	IGF1	CTGGCTAATTTTCTT GAGTTTT	Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM2770 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2770 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

Another function of GAM2770 is therefore inhibition of IGF1, a GAM2770 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2770 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2780	SNCAIP	TGAGTGACAGAGCAA CACTCTG	Synuclein, Alpha Interacting Protein (synphilin) (SNCAIP, Accession NM_005460.1) is a GAM2780 target gene. SNCAIP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SNCAIP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCAIP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2780 RNA are set forth in Tables 6 and 7, hereby incorporated herein.	A	A

A function of GAM2780 is therefore inhibition of SNCAIP, a GAM2780 target gene which promotes formation of cytosolic inclusions in neurons. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2780 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCAIP.The function of SNCAIP and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to GAM1300.

GAM2799 ACE TTGCCCAGGCTGGAG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A
TGCAGTG (ACE, Accession NM_152831.1) is a GAM2799 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2799 is therefore inhibition of ACE, a GAM2799 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2799 ADAM17 TTGCCCAGGCTGGAG A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A
TGCAGTG factor, (ADAM17, Accession NM_003183.3) is another GAM2799 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of ADAM17, a GAM2799 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM2799 CHAT TTGCCCAGGCTGGAG Choline Acetyltransferase (CHAT, Accession NM_020984.1) is A A
TGCAGTG another GAM2799 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of CHAT, a GAM2799 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM2799 FLNB TTGCCCAGGCTGGAG TGCAGTG Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is another GAM2799 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2799 is therefore inhibition of FLNB, a GAM2799 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM2799 HTR2A TTGCCCAGGCTGGAG TGCAGTG 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession NM_000621.1) is another GAM2799 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2799 is therefore inhibition of HTR2A, a GAM2799 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM2799 IAPP TTGCCCAGGCTGGAG TGCAGTG Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM2799 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, A A

corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of IAPP, a GAM2799 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM2799 NOTCH1 TTGCCCAGGCTGGAG Notch (Drosophila) Homolog 1 (translocation- associated) A A

TGCAGTG (NOTCH1, Accession NM_017617.2) is another GAM2799 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of NOTCH1, a GAM2799 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM2799 TGFB1 TTGCCCAGGCTGGAG TGFB1 (Accession NM_000660.1) is another GAM2799 target gene. A A

TGCAGTG TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of TGFB1. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM2799 ADAM17 CACTGCAACCTCCAC A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis B A

CTCCTGG factor, (ADAM17, Accession NM_003183.3) is another GAM2799 target gene. ADAM17 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of ADAM17, a GAM2799 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM2799 IAPP CACTGCAACCTCCAC Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is B A
CTCCTGG another GAM2799 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of IAPP, a GAM2799 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM2799 OGDH CACTGCAACCTCCAC Oxoglutarate Dehydrogenase (lipoamide) (OGDH, Accession B A
CTCCTGG NM_002541.1) is another GAM2799 target gene. OGDH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OGDH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OGDH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2799 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2799 is therefore inhibition of OGDH, a GAM2799 target gene which helps convert a- ketoglutarate to succinyl coenzyme A in Krebs cycle. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2799 include diagnosis,

prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OGDH.The function of OGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM2014.

GAM2807 CTSK AATCTCCATTTGTAA CTSK (Accession NM_000396.2) is a GAM2807 target gene. CTSK A A
ATGTGAC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSK BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2807 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2807 is therefore inhibition of CTSK. Accordingly, utilities of GAM2807 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSK.

GAM2808 NCKAP1 TAAGTGCTGCTGATT NCKAP1 (Accession NM_013436.2) is a GAM2808 target gene. NCKAP1 A A
TTGGAAA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2808 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2808 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM2808 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM2817 MME TGATTGTATGATATA Membrane Metallo- endopeptidase (neutral endopeptidase, A A
TGAGTTT enkephalinase, (MME, Accession NM_007287.1) is a GAM2817 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2817 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2817 is therefore inhibition of MME, a GAM2817 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2817 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2839 NGB GGGTCTCAAATGAGG Neuroglobin (NGB, Accession NM_021257.2) is a GAM2839 target A A

GACATTT gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2839 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2839 is therefore inhibition of NGB, a GAM2839 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2839 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2839 CHAT ACATTTCCAATGTTT Choline Acetyltransferase (CHAT, Accession NM_020986.1) is B A

GGGGACA another GAM2839 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2839 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2839 is therefore inhibition of CHAT, a GAM2839 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2839 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM2846 APBB2 TATTAGTTGATTCCA Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

AGGGACC 2 (Fe65- (APBB2, Accession NM_173075.1) is a GAM2846 target gene. APBB2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2846 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2846 is therefore inhibition of APBB2, a GAM2846 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer.

Accordingly, utilities of GAM2846 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2868 APLP2 TGGAATGGCTGAAGA A A CTGTGAA Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession NM_001642.1) is a GAM2868 target gene. APLP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2868 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2868 is therefore inhibition of APLP2, a GAM2868 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2868 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM2868 FLNB TGGAATGGCTGAAGA A A CTGTGAA Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is another GAM2868 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2868 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2868 is therefore inhibition of FLNB, a GAM2868 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2868 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM2868 SLC17A7 TGGAATGGCTGAAGA A A CTGTGAA SOLUTE CARRIER FAMILY 17, MEMBER 7 (SLC17A7, Accession NM_020309.1) is another GAM2868 target gene. SLC17A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC17A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC17A7 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2868 RNA

are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2868 is therefore inhibition of SLC17A7, a GAM2868 target gene which is a brain- specific Na-dependent inorganic phosphate cotransporter and therefore is associated with Alzheimer. Accordingly, utilities of GAM2868 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC17A7.The function of SLC17A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM2887 ABCD1 GGCCTGAGGTCAGCA ABCD1 (Accession NM_000033.2) is a GAM2887 target gene. ABCD1 A A

GTAGAGG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by ABCD1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ABCD1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2887 is therefore inhibition of ABCD1. Accordingly, utilities of GAM2887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ABCD1.

GAM2887 APBB1 GGCCTGAGGTCAGCA Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

GTAGAGG 1 (Fe65) (APBB1, Accession NM_145689.1) is another GAM2887 target gene. APBB1 BINDING SITE1 and APBB1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by APBB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB1 BINDING SITE1 and APBB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2887 is therefore inhibition of APBB1, a GAM2887 target gene which may modulate the internalization of beta- amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB1.The function of APBB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM2887 APLP2 GGCCTGAGGTCAGCA Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession A A

GTAGAGG NM_001642.1) is another GAM2887 target gene. APLP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP2, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2887 is therefore inhibition of APLP2, a GAM2887 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM2887 BAX GGCCTGAGGTCAGCA BCL2- associated X Protein (BAX, Accession NM_004324.2) is A A GTAGAGG another GAM2887 target gene. BAX BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BAX, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BAX BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2887 is therefore inhibition of BAX, a GAM2887 target gene which accelerates programmed cell death and therefore is associated with Alzheimer. Accordingly, utilities of GAM2887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BAX.The function of BAX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1650.

GAM2887 PRND GGCCTGAGGTCAGCA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A GTAGAGG another GAM2887 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2887 is therefore inhibition of PRND, a GAM2887 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to GAM44.

GAM2887 SLC17A7 GGCCTGAGGTCAGCA A A GTAGAGG SOLUTE CARRIER FAMILY 17, MEMBER 7 (SLC17A7, Accession NM_020309.1) is another GAM2887 target gene. SLC17A7 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC17A7, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC17A7 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2887 is therefore inhibition of SLC17A7, a GAM2887 target gene which is a brain- specific Na-dependent inorganic phosphate cotransporter and therefore is associated with Alzheimer. Accordingly, utilities of GAM2887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC17A7.The function of SLC17A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM354.

GAM2887 TRPM2 GGCCTGAGGTCAGCA A A GTAGAGG TRPM2 (Accession NM_003307.1) is another GAM2887 target gene. TRPM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2887 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2887 is therefore inhibition of TRPM2, a GAM2887 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM2887 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM2908 CTSB CCACTGCACTCCAGC A A ACTCCAG CTSB (Accession NM_147782.1) is a GAM2908 target gene. CTSB BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CTSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2908 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2908 is therefore inhibition of CTSB. Accordingly, utilities of GAM2908 include diagnosis, prevention and

treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM2908 FHL2 CCACTGCACTCCAGC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

ACTCCAG another GAM2908 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2908 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2908 is therefore inhibition of FHL2, a GAM2908 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2908 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2908 IGF1 CCACTGCACTCCAGC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

ACTCCAG NM_000618.2) is another GAM2908 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2908 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2908 is therefore inhibition of IGF1, a GAM2908 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2908 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2911 APBA2 GACACAGGCCCAGAG Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A

AGGCAG 2 (X11- l (APBA2, Accession NM_005503.2) is a GAM2911 target gene. APBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2911 RNA are set forth in Tables 6 and 7, hereby

incorporated herein.

A function of GAM2911 is therefore inhibition of APBA2, a GAM2911 target gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2911 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA2.The function of APBA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2911 CTSB GACACAGGCCCAGAG A A AGGCAG CTSB (Accession NM_001908.2) is another GAM2911 target gene. CTSB BINDING SITE1 and CTSB BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by CTSB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE1 and CTSB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2911 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2911 is therefore inhibition of CTSB. Accordingly, utilities of GAM2911 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM2911 DLST GACACAGGCCCAGAG A A AGGCAG Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM2911 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2911 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2911 is therefore inhibition of DLST, a GAM2911 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2911 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM2911 MAPT GACACAGGCCCAGAG A A AGGCAG Microtubule- associated Protein Tau (MAPT, Accession NM_173727.1) is another GAM2911 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple

transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2911 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2911 is therefore inhibition of MAPT, a GAM2911 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2911 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM2911 NCSTN GACACAGGCCCAGAG NCSTN (Accession NM_015331.1) is another GAM2911 target gene. A A
AGGCAG NCSTN BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCSTN, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCSTN BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2911 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2911 is therefore inhibition of NCSTN, a GAM2911 target gene which has a central role in presenilin-mediated processing of beta- amyloid precursor protein (beta- APP, MIM 104760) and some aspects of notch (MIM 190198)/glp- 1 signaling in vivo. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2911 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCSTN.The function of NCSTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2911 S100B GACACAGGCCCAGAG S100 Calcium- binding Protein, Beta (neural) (S100B, Accession A A
AGGCAG NM_006272.1) is another GAM2911 target gene. S100B BINDING SITE1 and S100B BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by S100B, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of S100B BINDING SITE1 and S100B BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2911 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2911 is therefore inhibition of S100B, a GAM2911 target gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities

exist for both ions on each monomer. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2911 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with S100B.The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.

GAM2920 A NGB GCTGAGACCACCCTT A GCCTGCC Neuroglobin (NGB, Accession NM_021257.2) is a GAM2920 target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2920 is therefore inhibition of NGB, a GAM2920 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2920 A TRPM2 GCTGAGACCACCCTT A GCCTGCC TRPM2 (Accession NM_003307.1) is another GAM2920 target gene. TRPM2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of TRPM2, a GAM2920 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM2920 A APBB2 GGCTGGGCATGGTGG A CTCACGC Amyloid Beta (A4) Precursor Protein- binding, Family B, Member B 2 (Fe65- (APBB2, Accession NM_173075.1) is another GAM2920 target gene. APBB2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APBB2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of APBB2, a GAM2920 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2920 AVP GGCTGGGCATGGTGG AVP (Accession NM_000490.2) is another GAM2920 target gene.
AVP B A

CTCACGC BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of AVP. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with AVP.

GAM2920 CTSB GGCTGGGCATGGTGG CTSB (Accession NM_147783.1) is another GAM2920 target gene.
B A

CTCACGC CTSB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CTSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of CTSB. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM2920 GFAP GGCTGGGCATGGTGG GFAP (Accession NM_002055.2) is another GAM2920 target gene.
B A

CTCACGC GFAP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of GFAP. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM2920 IGF1 GGCTGGGCATGGTGG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession B A
CTCACGC NM_000618.2) is another GAM2920 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of IGF1, a GAM2920 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2920 PRND GGCTGGGCATGGTGG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is B A
CTCACGC another GAM2920 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of PRND, a GAM2920 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM2920 TNF GGCTGGGCATGGTGG Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, B A
CTCACGC Accession NM_000594.2) is another GAM2920 target gene. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2920 RNA are set

forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2920 is therefore inhibition of TNF, a GAM2920 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly, utilities of GAM2920 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNF.The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM2927 OLR1 ATAAAGCAGGTTAAC Oxidised Low Density Lipoprotein (lectin- like) Receptor 1 A A AAAGCTG (OLR1, Accession NM_002543.1) is a GAM2927 target gene. OLR1 BINDING SITE1 and OLR1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by OLR1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OLR1 BINDING SITE1 and OLR1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2927 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2927 is therefore inhibition of OLR1, a GAM2927 target gene which is involved in degradation of oxidized LDL by vascular endothelial cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2927 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OLR1.The function of OLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2931 ADAMTS5 TGGAGAGAGCAGGTT A Disintegrin- like and Metalloprotease (reprolysin type) with A A GCTAAGA Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM2931 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2931 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM2931 is therefore inhibition of ADAMTS5, a GAM2931 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2931 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM2931 CTSK TGGAGAGAGCAGGTT CTSK (Accession NM_000396.2) is another GAM2931 target gene. A A

GCTAAGA CTSK BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTSK, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSK BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2931 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2931 is therefore inhibition of CTSK. Accordingly, utilities of GAM2931 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSK.

GAM2931 IGF1 TGGAGAGAGCAGGTT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

GCTAAGA NM_000618.2) is another GAM2931 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2931 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2931 is therefore inhibition of IGF1, a GAM2931 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM2931 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM2931 IL1B TGGAGAGAGCAGGTT Interleukin 1, Beta (IL1B, Accession NM_000576.2) is another A A

GCTAAGA GAM2931 target gene. IL1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1B BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2931 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2931 is therefore inhibition of IL1B, a GAM2931 target gene which stimulates thymocyte proliferation. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2931 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1B.The function of IL1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to GAM604.

GAM2931 MAPK10 TGGAGAGAGCAGGTT Mitogen- activated Protein Kinase 10 (MAPK10, Accession A A
GCTAAGA NM_138981.1) is another GAM2931 target gene. MAPK10 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2931 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2931 is therefore inhibition of MAPK10, a GAM2931 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2931 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM2931 MAPT TGGAGAGAGCAGGTT Microtubule- associated Protein Tau (MAPT, Accession A A
GCTAAGA NM_173727.1) is another GAM2931 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2931 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2931 is therefore inhibition of MAPT, a GAM2931 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2931 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM2931 TNF TGGAGAGAGCAGGTT Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, A A
GCTAAGA Accession NM_000594.2) is another GAM2931 target gene. TNF BINDING SITE1 and TNF BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TNF, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE1 and TNF BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM2931 RNA are set forth in Tables 6 and 7,

hereby incorporated herein.

Another function of GAM2931 is therefore inhibition of TNF, a GAM2931 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly, utilities of GAM2931 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNF.The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM2950 BACE2 AGGCCAGAGAGGACT CTCTTTT Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is a GAM2950 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2950 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM2950 is therefore inhibition of BACE2, a GAM2950 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM2950 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM2950 GYPA AGGCCAGAGAGGACT CTCTTTT Glycophorin A (includes MN blood group) (GYPA, Accession NM_002099.2) is another GAM2950 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2950 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM2950 is therefore inhibition of GYPA, a GAM2950 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2950 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM2950 IL1A AGGCCAGAGAGGACT Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another A A

CTCTTTT GAM2950 target gene. IL1A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2950 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2950 is therefore inhibition of IL1A, a GAM2950 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2950 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2950 MAPT AGGCCAGAGAGGACT Microtubule- associated Protein Tau (MAPT, Accession A A
CTCTTTT NM_173727.1) is another GAM2950 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2950 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2950 is therefore inhibition of MAPT, a GAM2950 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2950 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM2950 NGB AGGCCAGAGAGGACT Neuroglobin (NGB, Accession NM_021257.2) is another GAM2950 A A
CTCTTTT target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2950 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2950 is therefore inhibition of NGB, a GAM2950 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer.

Accordingly, utilities of GAM2950 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM2950 A A NPY AGGCCAGAGAGGACT CTCTTTT Neuropeptide Y (NPY, Accession NM_000905.2) is another GAM2950 target gene. NPY BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NPY, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NPY BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2950 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2950 is therefore inhibition of NPY, a GAM2950 target gene which is implicated in the control of feeding and in the secretion of gonadotrophin- release hormone. and therefore is associated with Alzheimer. Accordingly, utilities of GAM2950 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NPY.The function of NPY and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM193.

GAM2950 A A TRPM2 AGGCCAGAGAGGACT CTCTTTT TRPM2 (Accession NM_003307.1) is another GAM2950 target gene. TRPM2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM2950 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM2950 is therefore inhibition of TRPM2, a GAM2950 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM2950 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM3004 A A S100B TATTTGTTTTTAATG CTGGGTG S100 Calcium- binding Protein, Beta (neural) (S100B, Accession NM_006272.1) is a GAM3004 target gene. S100B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of S100B BINDING SITE, and secondary structure

complementarity to the nucleotide sequence of GAM3004 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3004 is therefore inhibition of S100B, a GAM3004 target gene which weakly binds calcium but binds zinc very tightly- distinct binding sites with different affinities exist for both ions on each monomer. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3004 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with S100B.The function of S100B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM106.

GAM3028 ACE TTCTGGTGAATTCAG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A GATGGTA (ACE, Accession NM_152831.1) is a GAM3028 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3028 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3028 is therefore inhibition of ACE, a GAM3028 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM3028 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3028 ADAM17 TTCTGGTGAATTCAG A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A GATGGTA factor, (ADAM17, Accession NM_021832.1) is another GAM3028 target gene. ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ADAM17, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3028 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3028 is therefore inhibition of ADAM17, a GAM3028 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3028 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM3028 BACE2 TTCTGGTGAATTCAG GATGGTA Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is another GAM3028 target gene. BACE2 BINDING SITE1 and BACE2 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE1 and BACE2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3028 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3028 is therefore inhibition of BACE2, a GAM3028 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3028 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM3028 IL1A TTCTGGTGAATTCAG GATGGTA Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another GAM3028 target gene. IL1A BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3028 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3028 is therefore inhibition of IL1A, a GAM3028 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3028 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM3028 NCKAP1 TTCTGGTGAATTCAG GATGGTA NCKAP1 (Accession NM_013436.2) is another GAM3028 target gene. A A

NCKAP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3028 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3028 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM3028 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM3028 OLR1 TTCTGGTGAATTCAG Oxidised Low Density Lipoprotein (lectin- like) Receptor 1 A A GATGGTA (OLR1, Accession NM_002543.1) is another GAM3028 target gene. OLR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OLR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OLR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3028 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3028 is therefore inhibition of OLR1, a GAM3028 target gene which is involved in degradation of oxidized LDL by vascular endothelial cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3028 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OLR1.The function of OLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3057 APBA1 GGCATGATTCAGCAG Amyloid Beta (A4) Precursor Protein- binding, Family A, Member A A AGGAGAG 1 (X11) (APBA1, Accession NM_001163.2) is a GAM3057 target gene. APBA1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3057 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3057 is therefore inhibition of APBA1, a GAM3057 target gene which stabilises APP and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3057 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA1.The function of APBA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM3057 GFAP GGCATGATTCAGCAG GFAP (Accession NM_002055.2) is another GAM3057 target gene. A A AGGAGAG GFAP BINDING SITE1 and GFAP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GFAP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE1 and GFAP BINDING SITE2, and secondary structure

complementarity to the nucleotide sequence of GAM3057 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3057 is therefore inhibition of GFAP. Accordingly, utilities of GAM3057 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM3057 IGF1 GGCATGATTCAGCAG Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

AGGAGAG NM_000618.2) is another GAM3057 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3057 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3057 is therefore inhibition of IGF1, a GAM3057 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3057 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3057 THOP1 GGCATGATTCAGCAG Thimet Oligopeptidase 1 (THOP1, Accession NM_003249.2) is A A

AGGAGAG another GAM3057 target gene. THOP1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by THOP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of THOP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3057 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3057 is therefore inhibition of THOP1, a GAM3057 target gene which involves in the metabolism of neuropeptide and in cytoplasmic peptide degradation. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3057 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with THOP1.The function of THOP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM520.

GAM3057 TRPM2 GGCATGATTCAGCAG TRPM2 (Accession NM_003307.1) is another GAM3057 target gene. A A

AGGAGAG TRPM2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3057 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3057 is therefore inhibition of TRPM2, a GAM3057 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM3057 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM3061 DLST TTAAAGATCACTTGA CATGGAC Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is a GAM3061 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3061 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3061 is therefore inhibition of DLST, a GAM3061 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3061 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM3064 PRND TTTAAGCTATAGTTC CAGGCCC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is a GAM3064 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3064 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3064 is therefore inhibition of PRND, a GAM3064 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3064 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3065 ACE GACATGATGTAGCAG Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A
ATGATGG (ACE, Accession NM_152831.1) is a GAM3065 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3065 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3065 is therefore inhibition of ACE, a GAM3065 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM3065 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3065 ADAMTS5 GACATGATGTAGCAG A Disintegrin- like and Metalloprotease (reprolysin type) with A A
ATGATGG Thrombos (ADAMTS5, Accession NM_007038.1) is another GAM3065 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3065 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3065 is therefore inhibition of ADAMTS5, a GAM3065 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3065 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM3065 APCS GACATGATGTAGCAG Amyloid P Component, Serum (APCS, Accession NM_001639.2) is A A
ATGATGG another GAM3065 target gene. APCS BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by APCS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APCS BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3065 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3065 is therefore inhibition of

APCS, a GAM3065 target gene which can interact with dna and histones and may scavenge nuclear material released from damaged circulating cells. may also function as a calcium- dependent lectin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3065 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APCS.The function of APCS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM772.

GAM3065 MME GACATGATGTAGCAG ATGATGG Membrane Metallo- endopeptidase (neutral endopeptidase, enkephalinase, (MME, Accession NM_000902.2) is another GAM3065 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3065 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3065 is therefore inhibition of MME, a GAM3065 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3065 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3065 OLR1 GACATGATGTAGCAG ATGATGG Oxidised Low Density Lipoprotein (lectin- like) Receptor 1 (OLR1, Accession NM_002543.1) is another GAM3065 target gene. OLR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OLR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OLR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3065 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3065 is therefore inhibition of OLR1, a GAM3065 target gene which is involved in degradation of oxidized LDL by vascular endothelial cells. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3065 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OLR1.The function of OLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3077 ACE TTACCATGTTGGCCA GGCTGGT Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_152831.1) is a GAM3077 target gene. ACE BINDING SITE1 and ACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ACE, A A

corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE1 and ACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3077 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3077 is therefore inhibition of ACE, a GAM3077 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM3077 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3077 ADAM17 TTACCATGTTGGCCA A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis A A
GGCTGGT factor, (ADAM17, Accession NM_003183.3) is another GAM3077 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3077 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3077 is therefore inhibition of ADAM17, a GAM3077 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3077 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM3077 IAPP TTACCATGTTGGCCA Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is A A
GGCTGGT another GAM3077 target gene. IAPP BINDING SITE1 and IAPP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IAPP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE1 and IAPP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3077 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3077 is therefore inhibition of IAPP, a GAM3077 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM3077 include diagnosis, prevention and treatment of Alzheimer, and of

other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM3077 IGF1 TTACCATGTTGGCCA GGCTGGT A A Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM3077 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3077 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3077 is therefore inhibition of IGF1, a GAM3077 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3077 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3077 TGFB1 TTACCATGTTGGCCA GGCTGGT A A TGFB1 (Accession NM_000660.1) is another GAM3077 target gene. TGFB1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TGFB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3077 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3077 is therefore inhibition of TGFB1. Accordingly, utilities of GAM3077 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM3081 ADAM17 CTGGGATTACAGGTG TGAACCA A A A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, (ADAM17, Accession NM_021832.1) is a GAM3081 target gene. ADAM17 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3081 is therefore inhibition of ADAM17, a GAM3081 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer.

Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM3081 CASP3 CTGGGATTACAGGTG Caspase 3, Apoptosis- related Cysteine Protease (CASP3, A A
TGAACCA Accession NM_004346.2) is another GAM3081 target gene. CASP3 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CASP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CASP3 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3081 is therefore inhibition of CASP3, a GAM3081 target gene which is one apoptosis- related cysteine protease and is important for the initiation of apoptotic cell death. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CASP3.The function of CASP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM801.

GAM3081 HTR2A CTGGGATTACAGGTG 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession A A
TGAACCA NM_000621.1) is another GAM3081 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3081 is therefore inhibition of HTR2A, a GAM3081 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM3081 IAPP CTGGGATTACAGGTG Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is A A
TGAACCA another GAM3081 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3081 is therefore inhibition of IAPP, a GAM3081 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM3081 MTNR1A CTGGGATTACAGGTG Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is A A
TGAACCA another GAM3081 target gene. MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MTNR1A, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3081 is therefore inhibition of MTNR1A, a GAM3081 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM3081 TGFB1 CTGGGATTACAGGTG TGFB1 (Accession NM_000660.1) is another GAM3081 target gene. A A
TGAACCA TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3081 is therefore inhibition of TGFB1. Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM3081 DSCR1 TGATTCATTTCTAAA Down Syndrome Critical Region Gene 1 (DSCR1, Accession B A

		CCCAGCT	NM_004414.3) is another GAM3081 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein. Another function of GAM3081 is therefore inhibition of DSCR1, a GAM3081 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.		
GAM3081	PRND	TGATTCATTTCTAAA CCCAGCT	Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM3081 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3081 RNA are set forth in Tables 6 and 7, hereby incorporated herein. Another function of GAM3081 is therefore inhibition of PRND, a GAM3081 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3081 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.	B	A
GAM3089	ACE	TTCAGCATTGCCAGT GTTTCCA	Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 (ACE, Accession NM_000789.2) is a GAM3089 target gene. ACE BINDING SITE1 and ACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE1 and ACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3089 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A function of GAM3089 is therefore inhibition of ACE, a GAM3089 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM3089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its	A	A

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3089 APPBP2 TTCAGCATTGCCAGT GTTTCCA Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is another GAM3089 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3089 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3089 is therefore inhibition of APPBP2, a GAM3089 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3089 CHAT TTCAGCATTGCCAGT GTTTCCA Choline Acetyltransferase (CHAT, Accession NM_020549.2) is another GAM3089 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3089 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3089 is therefore inhibition of CHAT, a GAM3089 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM3089 HTR2C TTCAGCATTGCCAGT GTTTCCA 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868.1) is another GAM3089 target gene. HTR2C BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3089 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3089 is therefore inhibition of HTR2C, a GAM3089 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3089 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM3091 DLST TGGGAGGCTACACGT Dihydrolipoamide S- succinyltransferase (E2 component of 2- A A
TTCTCCA oxo- glutarat (DLST, Accession NM_001933.2) is a GAM3091 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3091 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3091 is therefore inhibition of DLST, a GAM3091 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3091 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM3091 HD TGGGAGGCTACACGT HD (Accession NM_002111.3) is another GAM3091 target gene. HD A A
TTCTCCA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3091 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3091 is therefore inhibition of HD. Accordingly, utilities of GAM3091 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM3091 MAPT TGGGAGGCTACACGT Microtubule- associated Protein Tau (MAPT, Accession A A
TTCTCCA NM_173727.1) is another GAM3091 target gene. MAPT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MAPT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of

GAM3091 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3091 is therefore inhibition of MAPT, a GAM3091 target gene which Microtubule- associated protein tau; promotes microtubule assembly. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3091 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPT.The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM144.

GAM3123 PSEN2 CTTCAATGCTTGAGA PSEN2 (Accession NM_012486.1) is a GAM3123 target gene. PSEN2 A A
AGTCGTA BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by PSEN2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3123 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3123 is therefore inhibition of PSEN2. Accordingly, utilities of GAM3123 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN2.

GAM3126 APLP2 TGAGATCATCGTTAC Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession A A
AAGCAGC NM_001642.1) is a GAM3126 target gene. APLP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3126 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3126 is therefore inhibition of APLP2, a GAM3126 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3126 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM3126 FHL2 TGAGATCATCGTTAC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A
AAGCAGC another GAM3126 target gene. FHL2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FHL2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences

of FHL2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3126 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3126 is therefore inhibition of FHL2, a GAM3126 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3126 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM3132 NCKAP1 TAAGTGCTGCTGATT NCKAP1 (Accession NM_013436.2) is a GAM3132 target gene. NCKAP1 A A
TTGGAAA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3132 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3132 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM3132 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM3138 DSCR1 TGGTCTCTTGAAAGA Down Syndrome Critical Region Gene 1 (DSCR1, Accession A A
GGCTCTT NM_004414.3) is a GAM3138 target gene. DSCR1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DSCR1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DSCR1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3138 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3138 is therefore inhibition of DSCR1, a GAM3138 target gene which inhibits calcineurin- dependent transcriptional responses. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3138 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DSCR1.The function of DSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1332.

GAM3138 IL1B TGGTCTCTTGAAAGA Interleukin 1, Beta (IL1B, Accession NM_000576.2) is another A A
GGCTCTT GAM3138 target gene. IL1B BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1B, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences

of IL1B BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3138 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3138 is therefore inhibition of IL1B, a GAM3138 target gene which stimulates thymocyte proliferation. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3138 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1B.The function of IL1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM604.

GAM3140 A2M TGGAGCAGAAAGGCA GGAGTCC A A

Alpha- 2- macroglobulin (A2M, Accession NM_000014.3) is a GAM3140 target gene. A2M BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by A2M, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of A2M BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3140 is therefore inhibition of A2M, a GAM3140 target gene which inhibit all four classes of proteinases and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with A2M.The function of A2M and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1653.

GAM3140 APBB1 TGGAGCAGAAAGGCA GGAGTCC A A

Amyloid Beta (A4) Precursor Protein- binding, Family B, Member 1 (Fe65) (APBB1, Accession NM_145689.1) is another GAM3140 target gene. APBB1 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by APBB1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of APBB1, a GAM3140 target gene which may modulate the internalization of beta- amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB1.The function of APBB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to GAM347.

GAM3140 CHAT TGGAGCAGAAAGGCA Choline Acetyltransferase (CHAT, Accession NM_020986.1) is A A

GGAGTCC another GAM3140 target gene. CHAT BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of CHAT, a GAM3140 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM3140 DLST TGGAGCAGAAAGGCA Dihydrolipoamide S- succinyltransferase (E2 component of 2- A A

GGAGTCC oxo- glutarat (DLST, Accession NM_001933.2) is another GAM3140 target gene. DLST BINDING SITE1 and DLST BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DLST, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE1 and DLST BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of DLST, a GAM3140 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM3140 FPRL1 TGGAGCAGAAAGGCA FPRL1 (Accession NM_001462.1) is another GAM3140 target gene. A A

GGAGTCC FPRL1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of FPRL1. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM3140 A A GGAGTCC HTR2C TGGAGCAGAAAGGCA 5- hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868.1) is another GAM3140 target gene. HTR2C BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by HTR2C, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2C BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of HTR2C, a GAM3140 target gene which activates phospholipase C and regulates intracellular calcium flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2C.The function of HTR2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM31.

GAM3140 A A GGAGTCC MPO TGGAGCAGAAAGGCA Myeloperoxidase (MPO, Accession NM_000250.1) is another GAM3140 target gene. MPO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of MPO, a GAM3140 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM3140 A A GGAGTCC PRND TGGAGCAGAAAGGCA Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is another GAM3140 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7,

hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of PRND, a GAM3140 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3140 SLC6A4 TGGAGCAGAAAGGCA GGAGTCC Solute Carrier Family 6 (neurotransmitter transporter, serotonin), Mem (SLC6A4, Accession NM_001045.1) is another GAM3140 target gene. SLC6A4 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by SLC6A4, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SLC6A4 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3140 is therefore inhibition of SLC6A4, a GAM3140 target gene which terminates the action of serotonine by its high affinity sodium- dependent reuptake into presynaptic terminals. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SLC6A4.The function of SLC6A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1294.

GAM3140 TGFB1 TGGAGCAGAAAGGCA GGAGTCC TGFB1 (Accession NM_000660.1) is another GAM3140 target gene. TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3140 is therefore inhibition of TGFB1. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM3140 TNFRSF5 TGGAGCAGAAAGGCA GGAGTCC TNFRSF5 (Accession NM_152854.1) is another GAM3140 target gene. TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by TNFRSF5, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. A A

Nucleotide sequences of TNFRSF5 BINDING SITE1 and TNFRSF5 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3140 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3140 is therefore inhibition of TNFRSF5. Accordingly, utilities of GAM3140 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFRSF5.

GAM3143 BACE CAGAGGATGCGGCTG Beta- site APP- cleaving Enzyme (BACE, Accession NM_138973.1) A A

GGAACGG is a GAM3143 target gene. BACE BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3143 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3143 is therefore inhibition of BACE, a GAM3143 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3143 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM3143 HD CAGAGGATGCGGCTG HD (Accession NM_002111.3) is another GAM3143 target gene. HD A A

GGAACGG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3143 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3143 is therefore inhibition of HD. Accordingly, utilities of GAM3143 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM3143 MPO CAGAGGATGCGGCTG Myeloperoxidase (MPO, Accession NM_000250.1) is another GAM3143 A A

GGAACGG target gene. MPO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3143 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3143 is therefore inhibition of MPO, a GAM3143 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3143 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM3157 SNCA GTGAAGGTAGGTTTC SNCA (Accession NM_000345.2) is a GAM3157 target gene. SNCA A A

AGGTTTG BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3157 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3157 is therefore inhibition of SNCA. Accordingly, utilities of GAM3157 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM3163 FOS CACTGCAATGACTGT V- fos FBJ Murine Osteosarcoma Viral Oncogene Homolog (FOS, A A

CAGAACA Accession NM_005252.2) is a GAM3163 target gene. FOS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FOS BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3163 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3163 is therefore inhibition of FOS, a GAM3163 target gene which Transcription factor, acting with JUN, may alter DNA methylation and therefore is associated with Alzheimer. Accordingly, utilities of GAM3163 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FOS.The function of FOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM846.

GAM3163 HTR2A CACTGCAATGACTGT 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession A A

CAGAACA NM_000621.1) is another GAM3163 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure

complementarity to the nucleotide sequence of GAM3163 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3163 is therefore inhibition of HTR2A, a GAM3163 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3163 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM3174 GLUL TTTGATGCATGTGAC Glutamate- ammonia Ligase (glutamine synthase) (GLUL, Accession A A
CTGGGAT NM_002065.3) is a GAM3174 target gene. GLUL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GLUL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GLUL BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3174 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3174 is therefore inhibition of GLUL, a GAM3174 target gene which catalyzes the condensation of glutamate and ammonia to form glutamine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3174 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GLUL.The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM519.

GAM3174 TNFSF5 TTTGATGCATGTGAC TNFSF5 (Accession NM_000074.1) is another GAM3174 target gene. A A
CTGGGAT TNFSF5 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNFSF5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNFSF5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3174 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3174 is therefore inhibition of TNFSF5. Accordingly, utilities of GAM3174 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNFSF5.

GAM3183 CHAT AGTGCAGGTTCACAG Choline Acetyltransferase (CHAT, Accession NM_020984.1) is a A A
GCTGGGC GAM3183 target gene. CHAT BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by CHAT, corresponding to a target binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CHAT BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3183 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3183 is therefore inhibition of CHAT, a GAM3183 target gene which synthesizes the neurotransmitter acetylcholine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3183 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CHAT.The function of CHAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM3183 CLU AGTGCAGGTTCACAG GCTGGGC Clusterin (complement lysis inhibitor, SP- 40,40, sulfated glycoprotein (CLU, Accession NM_001831.1) is another GAM3183 target gene. CLU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CLU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CLU BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3183 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3183 is therefore inhibition of CLU, a GAM3183 target gene which has a role in the terminal complement reaction. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3183 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CLU.The function of CLU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1144.

GAM3183 CTSB AGTGCAGGTTCACAG GCTGGGC CTSB (Accession NM_147782.1) is another GAM3183 target gene. CTSB BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CTSB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTSB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3183 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3183 is therefore inhibition of CTSB. Accordingly, utilities of GAM3183 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTSB.

GAM3183 TRPM2 AGTGCAGGTTCACAG GCTGGGC TRPM2 (Accession NM_003307.1) is another GAM3183 target gene. TRPM2 BINDING SITE is a target binding site found in the 3` A A

untranslated region of mRNA encoded by TRPM2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3183 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3183 is therefore inhibition of TRPM2, a GAM3183 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM3183 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM3190 APPBP2 CATTGCACTCCAGCC TGGGCAA Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM3190 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3190 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3190 is therefore inhibition of APPBP2, a GAM3190 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3190 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3190 BACE2 CATTGCACTCCAGCC TGGGCAA Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138992.1) is another GAM3190 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3190 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3190 is therefore inhibition of BACE2, a GAM3190 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3190 include diagnosis, prevention and treatment of Alzheimer, and of other

diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM3190 FHL2 CATTGCACTCCAGCC Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

TGGGCAA another GAM3190 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3190 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3190 is therefore inhibition of FHL2, a GAM3190 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3190 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM3190 HD CATTGCACTCCAGCC HD (Accession NM_002111.3) is another GAM3190 target gene. HD A A

TGGGCAA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3190 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3190 is therefore inhibition of HD. Accordingly, utilities of GAM3190 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM3190 IGF1 CATTGCACTCCAGCC Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

TGGGCAA NM_000618.2) is another GAM3190 target gene. IGF1 BINDING SITE1 and IGF1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by IGF1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE1 and IGF1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3190 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3190 is therefore inhibition of IGF1, a GAM3190 target gene which are structurally and functionally

related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3190 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3190 PRND CATTGCACTCCAGCC Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

TGGGCAA another GAM3190 target gene. PRND BINDING SITE1 through PRND BINDING SITE4 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE4, and secondary structure complementarity to the nucleotide sequence of GAM3190 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3190 is therefore inhibition of PRND, a GAM3190 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3190 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3195 ADAM10 TGAGGGCAGGTGTGA A Disintegrin and Metalloproteinase Domain 10 (ADAM10, A A

AAATGCT Accession NM_001110.1) is a GAM3195 target gene. ADAM10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3195 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3195 is therefore inhibition of ADAM10, a GAM3195 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3195 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM10.The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1300.

GAM3195 APBB2 TGAGGGCAGGTGTGA Amyloid Beta (A4) Precursor Protein- binding, Family B, Member A A

AAATGCT 2 (Fe65- (APBB2, Accession NM_173075.1) is another GAM3195 target gene. APBB2 BINDING SITE1 and APBB2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APBB2,

corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBB2 BINDING SITE1 and APBB2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3195 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3195 is therefore inhibition of APBB2, a GAM3195 target gene which Interacts with beta- amyloid precursor protein and with APLP2. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3195 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBB2.The function of APBB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3195 FPRL1 TGAGGGCAGGTGTGA A A AAATGCT FPRL1 (Accession NM_001462.1) is another GAM3195 target gene. FPRL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3195 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3195 is therefore inhibition of FPRL1. Accordingly, utilities of GAM3195 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM3195 IGF1 TGAGGGCAGGTGTGA A A AAATGCT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM3195 target gene. IGF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3195 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3195 is therefore inhibition of IGF1, a GAM3195 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3195 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3195 MAPK10 TGAGGGCAGGTGTGA A A Mitogen- activated Protein Kinase 10 (MAPK10, Accession

AAATGCT NM_138981.1) is another GAM3195 target gene. MAPK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3195 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3195 is therefore inhibition of MAPK10, a GAM3195 target gene which is a members of the mitogen-activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3195 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM3195 A A SNCA TGAGGGCAGGTGTGA AAATGCT SNCA (Accession NM_007308.1) is another GAM3195 target gene. SNCA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3195 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3195 is therefore inhibition of SNCA. Accordingly, utilities of GAM3195 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM3211 A A HTR2A TCTCATATAGCTGGG TTGCAGC 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession NM_000621.1) is a GAM3211 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3211 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3211 is therefore inhibition of HTR2A, a GAM3211 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3211 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to GAM593.

GAM3211 A NGB TCTCATATAGCTGGG TTGCAGC A Neuroglobin (NGB, Accession NM_021257.2) is another GAM3211 target gene. NGB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NGB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3211 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3211 is therefore inhibition of NGB, a GAM3211 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3211 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM3211 B FLNB TCACTGTTCCTTTTT GTTGAGA A Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is another GAM3211 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3211 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3211 is therefore inhibition of FLNB, a GAM3211 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3211 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM3211 B FPRL1 TCACTGTTCCTTTTT GTTGAGA A FPRL1 (Accession NM_001462.1) is another GAM3211 target gene. FPRL1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FPRL1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3211 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3211 is therefore inhibition of

FPRL1. Accordingly, utilities of GAM3211 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM3211 IGF1 TCACTGTTCCTTTTT GTTGAGA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM3211 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3211 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM3211 is therefore inhibition of IGF1, a GAM3211 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3211 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3227 APPBP2 ACTGCACTCCAGCCT GGGCAAC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM3227 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3227 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3227 is therefore inhibition of APPBP2, a GAM3227 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3227 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3227 BACE2 ACTGCACTCCAGCCT GGGCAAC Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_012105.3) is another GAM3227 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3227 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3227 is therefore inhibition of BACE2, a GAM3227 target gene which cleaves intracellularly the b-secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3227 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM3227 FHL2 ACTGCACTCCAGCCT Four and A Half LIM Domains 2 (FHL2, Accession NM_001450.2) is A A

GGGCAAC another GAM3227 target gene. FHL2 BINDING SITE1 and FHL2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FHL2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FHL2 BINDING SITE1 and FHL2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3227 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3227 is therefore inhibition of FHL2, a GAM3227 target gene which Contains four LIM domains and an additional zinc finger. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3227 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FHL2.The function of FHL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM3227 IGF1 ACTGCACTCCAGCCT Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession A A

GGGCAAC NM_000618.2) is another GAM3227 target gene. IGF1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3227 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3227 is therefore inhibition of IGF1, a GAM3227 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3227 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3227 MME ACTGCACTCCAGCCT Membrane Metallo- endopeptidase (neutral endopeptidase, A A

GGGCAAC enkephalinase, (MME, Accession NM_000902.2) is another GAM3227 target gene. MME BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3227 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3227 is therefore inhibition of MME, a GAM3227 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3227 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3227 PRND ACTGCACTCCAGCCT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

GGGCAAC another GAM3227 target gene. PRND BINDING SITE1 through PRND BINDING SITE3 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 through PRND BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM3227 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3227 is therefore inhibition of PRND, a GAM3227 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3227 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3236 CRYAB TTCAAGAAAGCCAAG CRYAB (Accession NM_001885.1) is a GAM3236 target gene. CRYAB A A

ATGGCTG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CRYAB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CRYAB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3236 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3236 is therefore inhibition of CRYAB. Accordingly, utilities of GAM3236 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CRYAB.

GAM3236 GLUL TTCAAGAAAGCCAAG Glutamate- ammonia Ligase (glutamine synthase) (GLUL, Accession A A

ATGGCTG NM_002065.3) is another GAM3236 target gene. GLUL BINDING SITE1 and GLUL BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by GLUL, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GLUL BINDING SITE1 and GLUL BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3236 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3236 is therefore inhibition of GLUL, a GAM3236 target gene which catalyzes the condensation of glutamate and ammonia to form glutamine. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3236 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GLUL.The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM519.

GAM3236 NOTCH1 TTCAAGAAAGCCAAG Notch (Drosophila) Homolog 1 (translocation- associated) A A

ATGGCTG (NOTCH1, Accession NM_017617.2) is another GAM3236 target gene. NOTCH1 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by NOTCH1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NOTCH1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3236 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3236 is therefore inhibition of NOTCH1, a GAM3236 target gene which is possibly involved in cell differentiation and lymphocyte function. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3236 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NOTCH1.The function of NOTCH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM3263 AVP TTGCCTGGAGACATT AVP (Accession NM_000490.2) is a GAM3263 target gene. AVP A A

TCTACTG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by AVP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of AVP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3263 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3263 is therefore inhibition of AVP. Accordingly, utilities of GAM3263 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical

conditions associated with AVP.

GAM3263 GYPA TTGCCTGGAGACATT Glycophorin A (includes MN blood group) (GYPA, Accession A A
TCTACTG NM_002099.2) is another GAM3263 target gene. GYPA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GYPA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GYPA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3263 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3263 is therefore inhibition of GYPA, a GAM3263 target gene which determines the M or N blood group. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3263 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GYPA.The function of GYPA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM3266 BACE AAGCAGCCTTGGACC Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A
AGGAGGG is a GAM3266 target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by BACE, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3266 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3266 is therefore inhibition of BACE, a GAM3266 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3266 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM3266 IL1A AAGCAGCCTTGGACC Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another A A
AGGAGGG GAM3266 target gene. IL1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3266 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3266 is therefore inhibition of IL1A, a GAM3266 target gene which stimulates thymocyte proliferation

by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3266 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM3271 TNF TTCTACTAGTGGTTG ATGGCCT Tumor Necrosis Factor (TNF superfamily, member 2) (TNF, Accession NM_000594.2) is a GAM3271 target gene. TNF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by TNF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TNF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3271 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3271 is therefore inhibition of TNF, a GAM3271 target gene which mediates proinflammatory responses and apoptosis and therefore is associated with Alzheimer. Accordingly, utilities of GAM3271 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TNF.The function of TNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM3293 APPBP2 CTCTTGAAGGAGTAT TTGTGTT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM3293 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3293 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3293 is therefore inhibition of APPBP2, a GAM3293 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3293 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3293 GAL AGCAAAAGCCATGCC CAGGAGA Galanin (GAL, Accession NM_015973.2) is another GAM3293 target gene. GAL BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GAL, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GAL BINDING SITE, B A

and secondary structure complementarity to the nucleotide sequence of GAM3293 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3293 is therefore inhibition of GAL, a GAM3293 target gene which stimulates LH secretion and enhances LHRH- induced LH release from dispersed anterior pituitary cells in vitro. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3293 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GAL.The function of GAL has been established by previous studies. Galanin is a 29- amino acid peptide widely distributed in the peripheral and central nervous systems. In the brain, the highest concentrations are observed in the hypothalamus and particularly in the nerve terminals of the median eminence. Since the establishment of the neurovascular concept in the regulation of the hypothalamus- pituitary axis (Harris, 1948), it is well known that the median eminence represents a key area for neuroendocrine regulation. Hypothalamic releasing and inhibiting factors are secreted from median eminence terminals into the portal circulation to reach the adenohypophyseal cells where they exert specific actions. Lopez et al. (1991) presented evidence that galanin meets the criteria to be considered a hypothalamic-hypophysiotropic hormone. They found a possibly meaningful colocalization and cosecretion of galanin and LHRH (OMIM Ref. No. 152760). Galanin stimulates LH secretion and enhances LHRH- induced LH release from dispersed anterior pituitary cells in vitro. Galanin is important to gastrointestinal function also (Rattan, 1991). Animal model experiments lend further support to the function of GAL. The neuropeptide galanin is predominantly expressed by the lactotrophs (the prolactin- secreting cell type) in the rodent anterior pituitary and in the median eminence and paraventricular nucleus of the hypothalamus. Prolactin (PRL; 176760) and galanin colocalize in the same secretory granule, and the expression of both proteins is extremely sensitive to the estrogen status of the animal. Administration of estradiol- 17- beta induces pituitary hyperplasia followed by adenoma formation and causes a 3,000- fold increase in the galanin mRNA content of the lactotroph. To further study the role of galanin in prolactin release and lactotroph growth, Wynick et al. (1998) generated mice carrying a loss- of-function mutation of the endogenous galanin gene. There was no evidence of embryonic lethality and the mutant mice grew normally. The specific endocrine abnormalities identified related to the expression of prolactin. Pituitary prolactin message levels and protein content of adult female mutant mice were reduced by 30 to 40% compared with wildtype controls. Mutant females failed to lactate and pups died of starvation/dehydration unless fostered onto wildtype mothers. Prolactin secretion in mutant females was markedly reduced at 7 days postpartum compared with wildtype controls with an associated failure in mammary gland maturation. There was almost

complete abrogation of the proliferative response of the lactotroph to high doses of estrogen, with a failure to upregulate prolactin release and STAT5 (OMIM Ref. No. 601511) expression or to increase pituitary cell number. These data supported the hypothesis that galanin acts as a paracrine regulator of prolactin expression and as a growth factor to the lactotroph.

It is appreciated that the abovementioned animal model for GAL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Wynick, D.; Small, C. J.; Bacon, A.; Holmes, F. E.; Norman, M.; Ormandy, C. J.; Kilic, E.; Kerr, N. C. H.; Ghatei, M.; Talamantes, F.; Bloom, S. R.; Pachnis, V. : Galanin regulates prolactin release and lactotroph proliferation. Proc. Nat. Acad. Sci. 95: 12671-12676, 1998. ; and

Lopez, F. J.; Merchenthaler, I.; Ching, M.; Wisniewski, M. G.; Negro- Vilar, A. : Galanin: a hypothalamic- hypophysiotropic hormone modulating reproductive functions. Proc. Nat. Acad. Sci.

Further studies establishing the function and utilities of GAL are found in John Hopkins OMIM database record ID 137035, and in cited publications listed in Table 9, hereby incorporated herein.

GAM3293 IGF1 AGCAAAAGCCATGCC CAGGAGA Insulin- like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618.2) is another GAM3293 target gene. IGF1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by IGF1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IGF1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3293 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM3293 is therefore inhibition of IGF1, a GAM3293 target gene which are structurally and functionally related to insulin but have a much higher growth- promoting activity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3293 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IGF1.The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3298 APP AAAGTGCTCATAGTG APP (Accession NM_000484.1) is a GAM3298 target gene. APP A A

CAGGTAG BINDING SITE1 and APP BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APP, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APP BINDING SITE1 and APP BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3298 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3298 is therefore inhibition of APP. Accordingly, utilities of GAM3298 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APP.

GAM3298 MTNR1A AAAGTGCTCATAGTG Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is A A

CAGGTAG another GAM3298 target gene. MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by MTNR1A, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE1 and MTNR1A BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3298 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3298 is therefore inhibition of MTNR1A, a GAM3298 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3298 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM3298 PRND AAAGTGCTCATAGTG Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A

CAGGTAG another GAM3298 target gene. PRND BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PRND, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3298 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3298 is therefore inhibition of PRND, a GAM3298 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3298 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3298 PSEN1 AAAGTGCTCATAGTG PSEN1 (Accession NM_000021.2) is another GAM3298 target gene.
A A

CAGGTAG PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by PSEN1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3298 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3298 is therefore inhibition of PSEN1. Accordingly, utilities of GAM3298 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PSEN1.

GAM3298 TGFB1 AAAGTGCTCATAGTG TGFB1 (Accession NM_000660.1) is another GAM3298 target gene.
A A

CAGGTAG TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3298 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3298 is therefore inhibition of TGFB1. Accordingly, utilities of GAM3298 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM3298 TRPM2 AAAGTGCTCATAGTG TRPM2 (Accession NM_003307.1) is another GAM3298 target gene.
A A

CAGGTAG TRPM2 BINDING SITE1 and TRPM2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TRPM2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TRPM2 BINDING SITE1 and TRPM2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3298 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3298 is therefore inhibition of TRPM2, a GAM3298 target gene which may be a calcium channel and therefore is associated with Alzheimer. Accordingly, utilities of GAM3298 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TRPM2.The function of TRPM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM335.

GAM3298 UBB AAAGTGCTCATAGTG Ubiquitin B (UBB, Accession NM_018955.2) is another GAM3298 A
A

CAGGTAG target gene. UBB BINDING SITE1 and UBB BINDING SITE2 are target

binding sites found in untranslated regions of mRNA encoded by UBB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of UBB BINDING SITE1 and UBB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3298 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3298 is therefore inhibition of UBB, a GAM3298 target gene which marks cellular proteins for degradation and therefore is associated with Alzheimer. Accordingly, utilities of GAM3298 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with UBB.The function of UBB has been established by previous studies. Ubiquitin (see OMIM Ref. No. 191320) may be evolution's most conserved protein, presumably because of its role in several important cellular processes. By in situ hybridization, Webb et al. (1990) assigned the 3- coding unit polyubiquitin gene UBB and its nonprocessed pseudogene to 17p12- p11.1. See also ubiquitin C (OMIM Ref. No. 191340). The protein deposits in neurofibrillary tangles, neuritic plaques, and neuropil threads in the cerebral cortex of patients with Alzheimer disease (AD; 104300) and Down syndrome (OMIM Ref. No. 190685) contain forms of beta- amyloid precursor protein (APP; 104760) and ubiquitin- B that are aberrant in the C terminus. These proteins are not found in young control subjects, whereas the presence of anomalous UBB in elderly control patients may indicate early stages of neurodegeneration. The 2 species of aberrant proteins were found by van Leeuwen et al. (1998) to display cellular colocalization, suggesting a common origin, operating at the transcriptional level or by posttranscriptional editing of RNA. This type of transcript mutation is likely an important factor in the widely occurring nonfamilial early- and late- onset forms of AD. The aberrant proteins were not found in patients with Parkinson disease (OMIM Ref. No. 168600). Using 2 different sensitive approaches, van Leeuwen et al. (1998) failed to find any indication of the mutation at the genomic level. The finding that frameshift mutations occur in multiple proteins within the same neuron suggested that a common denominator in the transcription- propagating events was involved. The mechanism of transcript mutation, which was a dinucleotide deletion (delta- GA, delta- GT, or delta- CT), was unclear. The frequently mutated motif in exon 9 of the APP gene, GAGAGAGA, is an extended version of the GAGAG in the vasopressin gene (OMIM Ref. No. 192340), which shows a GA deletion in vasopressin transcripts of the homozygous Brattleboro rats with diabetes insipidus. The authors commented that transcript mutations may be a widely occurring phenomenon. In principle, each transcript containing a susceptible motif, such as GAGAG, could undergo such a process. Van Leeuwen et al. (1998) stated that the process is probably not limited to postmitotic cells; however, postmitotic neurons are less capable of compensating for transcript- modifying activity and are thus particularly sensitive to the accumulation of frameshifted proteins.

Thus, during aging, single neurons may generate and accumulate abnormal proteins, consequently leading to cellular disturbances and causing degeneration. The mechanism of dinucleotide deletion at the transcript level may well underlie a number of neurodegenerative pathologies

Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

van Leeuwen, F. W.; de Kleijn, D. P. V.; van den Hurk, H. H.; Neubauer, A.; Sonnemans, M. A. F.; Sluijs, J. A.; Koycu, S.; Ramdjielal, R. D. J.; Salehi, A.; Martens, G. J. M.; Grosveld, F. G.; Burbach, J. P. H.; Hol, E. M. : Frameshift mutants of beta-amyloid precursor protein and ubiquitin- B in Alzheimer's and Down patients. Science 279: 242- 247, 1998. ; and

Webb, G. C.; Baker, R. T.; Fagan, K.; Board, P. G. : Localization of the human UbB polyubiquitin gene to chromosome band 17p11.1- 17p12. Am. J. Hum. Genet. 46: 308- 315, 1990.

Further studies establishing the function and utilities of UBB are found in John Hopkins OMIM database record ID 191339, and in cited publications listed in Table 9, hereby incorporated herein.

GAM3311 A ACAGATA FOS GTGTGTGATAAGGAC V- fos FBJ Murine Osteosarcoma Viral Oncogene Homolog (FOS, Accession NM_005252.2) is a GAM3311 target gene. FOS BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FOS, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FOS BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3311 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3311 is therefore inhibition of FOS, a GAM3311 target gene which Transcription factor, acting with JUN, may alter DNA methylation and therefore is associated with Alzheimer. Accordingly, utilities of GAM3311 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FOS.The function of FOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM846.

GAM3311 A ACAGATA MPO GTGTGTGATAAGGAC Myeloperoxidase (MPO, Accession NM_000250.1) is another GAM3311 target gene. MPO BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MPO, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MPO BINDING SITE, and secondary structure complementarity to the nucleotide sequence

of GAM3311 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3311 is therefore inhibition of MPO, a GAM3311 target gene which is present in primary granules of neutrophilic granulocytes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3311 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MPO.The function of MPO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1032.

GAM3311 FLNB GTCTGCTGTCTACAC TACACAC Filamin B, Beta (actin- binding protein- 278) (FLNB, Accession NM_001457.1) is another GAM3311 target gene. FLNB BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by FLNB, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FLNB BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3311 RNA are set forth in Tables 6 and 7, hereby incorporated herein. B A

Another function of GAM3311 is therefore inhibition of FLNB, a GAM3311 target gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3311 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FLNB.The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1193.

GAM3330 BACE2 ATAACTGTGAAGAGG CAATTGT Beta- site APP- cleaving Enzyme 2 (BACE2, Accession NM_138991.1) is a GAM3330 target gene. BACE2 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3330 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3330 is therefore inhibition of BACE2, a GAM3330 target gene which cleaves intracellularly the b- secretase site of amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3330 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE2.The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM189.

GAM3350 APPBP2 TGCAGATACATGTGT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
AACTGAA Protein 2 (APPBP2, Accession NM_006380.2) is a GAM3350 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3350 is therefore inhibition of APPBP2, a GAM3350 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3350 ARHA TGCAGATACATGTGT Ras Homolog Gene Family, Member A (ARHA, Accession NM_001664.1) A A
AACTGAA is another GAM3350 target gene. ARHA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ARHA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3350 is therefore inhibition of ARHA, a GAM3350 target gene which regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ARHA.The function of ARHA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.

GAM3350 DLST TGCAGATACATGTGT Dihydrolipoamide S- succinyltransferase (E2 component of 2- A A
AACTGAA oxo- glutarat (DLST, Accession NM_001933.2) is another GAM3350 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3350 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3350 is therefore inhibition of DLST, a GAM3350 target gene which catalyzes the oxidative

decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3350 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM3368 HTR2A GATTTTCATAGGAGC 5- hydroxytryptamine (serotonin) Receptor 2A (HTR2A, Accession A A

AGAAACC NM_000621.1) is a GAM3368 target gene. HTR2A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HTR2A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HTR2A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3368 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3368 is therefore inhibition of HTR2A, a GAM3368 target gene which modulates phosphatidylinositol production and intracellular Ca2 flux. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3368 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HTR2A.The function of HTR2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM593.

GAM3414 IL1A TGGAGAAATTATATT Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is a GAM3414 A A

TTACTAA target gene. IL1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3414 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3414 is therefore inhibition of IL1A, a GAM3414 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3414 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM3414 PLAU TGGAGAAATTATATT Plasminogen Activator, Urokinase (PLAU, Accession NM_002658.1) A A

TTACTAA is another GAM3414 target gene. PLAU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by

PLAU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PLAU BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3414 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3414 is therefore inhibition of PLAU, a GAM3414 target gene which is an urokinase plasminogen activator and serine protease . and therefore is associated with Alzheimer. Accordingly, utilities of GAM3414 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PLAU.The function of PLAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM282.

GAM3422 MME TCTTTTTTGGGAGAC Membrane Metallo- endopeptidase (neutral endopeptidase, A A

GGAGTCG enkephalinase, (MME, Accession NM_000902.2) is a GAM3422 target gene. MME BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by MME, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MME BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3422 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3422 is therefore inhibition of MME, a GAM3422 target gene which is thermolysin- like specificity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3422 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MME.The function of MME and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM25.

GAM3426 DHCR24 TCACCCAGTGTAAAC 24- dehydrocholesterol Reductase (DHCR24, Accession A A

AGCATGA NM_014762.1) is a GAM3426 target gene. DHCR24 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DHCR24, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DHCR24 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3426 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3426 is therefore inhibition of DHCR24, a GAM3426 target gene which catalyzes the reduction of sterol intermediates. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3426 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DHCR24.The function of DHCR24 and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3426 PLAU TCACCCAGTGTAAAC Plasminogen Activator, Urokinase (PLAU, Accession NM_002658.1) A A

AGCATGA is another GAM3426 target gene. PLAU BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by PLAU, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PLAU BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3426 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3426 is therefore inhibition of PLAU, a GAM3426 target gene which is an urokinase plasminogen activator and serine protease . and therefore is associated with Alzheimer. Accordingly, utilities of GAM3426 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PLAU.The function of PLAU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM282.

GAM3431 APPBP2 TAATACTGCCGGGTA Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A

ATGATGG Protein 2 (APPBP2, Accession NM_006380.2) is a GAM3431 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3431 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3431 is therefore inhibition of APPBP2, a GAM3431 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3431 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3431 BACE TAATACTGCCGGGTA Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A

ATGATGG is another GAM3431 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3431 RNA are set forth in Tables 6 and 7, hereby incorporated

herein.

Another function of GAM3431 is therefore inhibition of BACE, a GAM3431 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3431 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM3452 GFAP GCCTTTCCTCCAGAA GFAP (Accession NM_002055.2) is a GAM3452 target gene. GFAP A A
CTGCTCC BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by GFAP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of GFAP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3452 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3452 is therefore inhibition of GFAP. Accordingly, utilities of GAM3452 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with GFAP.

GAM3452 OGDH GCCTTTCCTCCAGAA Oxoglutarate Dehydrogenase (lipoamide) (OGDH, Accession A A
CTGCTCC NM_002541.1) is another GAM3452 target gene. OGDH BINDING SITE1 and OGDH BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by OGDH, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OGDH BINDING SITE1 and OGDH BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3452 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3452 is therefore inhibition of OGDH, a GAM3452 target gene which helps convert a- ketoglutarate to succinyl coenzyme A in Krebs cycle. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3452 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OGDH.The function of OGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM2014.

GAM3461 APPBP2 TATTACATTCATTTT Amyloid Beta Precursor Protein (cytoplasmic tail)- binding A A
GATGGTT Protein 2 (APPBP2, Accession NM_006380.2) is a GAM3461 target gene. APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by APPBP2, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences

of APPBP2 BINDING SITE1 and APPBP2 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3461 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3461 is therefore inhibition of APPBP2, a GAM3461 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3461 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3461 IL1A TATTACATTCATTTT GATGGTT Interleukin 1, Alpha (IL1A, Accession NM_000575.3) is another GAM3461 target gene. IL1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IL1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IL1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3461 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3461 is therefore inhibition of IL1A, a GAM3461 target gene which stimulates thymocyte proliferation by inducing il- 2 release, b- cell maturation & proliferation, & fibroblast growth factor activity. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3461 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IL1A.The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM3463 SNCA CACAATATAGCAAAT AGAGGGT SNCA (Accession NM_000345.2) is a GAM3463 target gene. SNCA BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3463 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3463 is therefore inhibition of SNCA. Accordingly, utilities of GAM3463 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM3479 ADAMTS5 TACAGGCAGGCACAG AGGCAGT A Disintegrin- like and Metalloprotease (reprolysin type) with Thrombos (ADAMTS5, Accession NM_007038.1) is a GAM3479 target gene. ADAMTS5 BINDING SITE is a target binding site found in the 3` A A

untranslated region of mRNA encoded by ADAMTS5, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAMTS5 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3479 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3479 is therefore inhibition of ADAMTS5, a GAM3479 target gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAMTS5.The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM3479 APBA2 TACAGGCAGGCACAG AGGCAGT A A Amyloid Beta (A4) Precursor Protein- binding, Family A, Member 2 (X11- l (APBA2, Accession NM_005503.2) is another GAM3479 target gene. APBA2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APBA2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APBA2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3479 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3479 is therefore inhibition of APBA2, a GAM3479 target gene which interacts with and stabilisesthe Alzheimer's disease amyloid precursor protein (APP) and inhibits production of proteolytic APP fragments. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APBA2.The function of APBA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1216.

GAM3479 DLST TACAGGCAGGCACAG AGGCAGT A A Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM3479 target gene. DLST BINDING SITE1 and DLST BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by DLST, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE1 and DLST BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3479 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3479 is therefore inhibition of DLST, a GAM3479 target gene which catalyzes the oxidative

decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM3479 NGB TACAGGCAGGCACAG Neuroglobin (NGB, Accession NM_021257.2) is another GAM3479 target gene. NGB BINDING SITE1 and NGB BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by NGB, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NGB BINDING SITE1 and NGB BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3479 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A A

AGGCAGT

Another function of GAM3479 is therefore inhibition of NGB, a GAM3479 target gene which has function in oxygen transport and storage in humans. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NGB.The function of NGB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM281.

GAM3479 SNCG TACAGGCAGGCACAG SYNUCLEIN, GAMMA (SNCG, Accession NM_003087.1) is another GAM3479 target gene. SNCG BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by SNCG, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCG BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3479 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A A

AGGCAGT

Another function of GAM3479 is therefore inhibition of SNCG, a GAM3479 target gene which plays a role in neurofilament network integrity and therefore is associated with Alzheimer. Accordingly, utilities of GAM3479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCG.The function of SNCG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM869.

GAM3479 TFCP2 TACAGGCAGGCACAG Transcription Factor CP2 (TFCP2, Accession NM_005653.2) is another GAM3479 target gene. TFCP2 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by TFCP2, corresponding to a target binding site such as BINDING SITE I,

A A

AGGCAGT

BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TFCP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3479 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3479 is therefore inhibition of TFCP2, a GAM3479 target gene which is a transcription factor CP2 and recognizes sites within the alpha- globin gene and SV40 late promoters. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TFCP2.The function of TFCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM760.

GAM3479 TGFB1 TACAGGCAGGCACAG TGFB1 (Accession NM_000660.1) is another GAM3479 target gene. A A

AGGCAGT TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by TGFB1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of TGFB1 BINDING SITE1 and TGFB1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3479 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3479 is therefore inhibition of TGFB1. Accordingly, utilities of GAM3479 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with TGFB1.

GAM3486 OGDH TTAGTGTTCAGGCTC Oxoglutarate Dehydrogenase (lipoamide) (OGDH, Accession A A

AAATGAA NM_002541.1) is a GAM3486 target gene. OGDH BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by OGDH, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of OGDH BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3486 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3486 is therefore inhibition of OGDH, a GAM3486 target gene which helps convert a- ketoglutarate to succinyl coenzyme A in Krebs cycle. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3486 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with OGDH.The function of OGDH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM2014.

GAM3486 SNCA TTAGTGTTCAGGCTC SNCA (Accession NM_000345.2) is another GAM3486 target gene. A A

AAATGAA SNCA BINDING SITE is a target binding site found in the 3`

untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3486 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3486 is therefore inhibition of SNCA. Accordingly, utilities of GAM3486 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM3513 ADAM17 CACTGCAAGCTCCAC CTCCCGG A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, (ADAM17, Accession NM_003183.3) is a GAM3513 target gene. ADAM17 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by ADAM17, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3513 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3513 is therefore inhibition of ADAM17, a GAM3513 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3513 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM3513 IAPP CACTGCAAGCTCCAC CTCCCGG Islet Amyloid Polypeptide (IAPP, Accession NM_000415.1) is another GAM3513 target gene. IAPP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by IAPP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of IAPP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3513 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3513 is therefore inhibition of IAPP, a GAM3513 target gene which selectively inhibits insulin-stimulated glucose utilization and glycogen deposition and therefore is associated with Alzheimer. Accordingly, utilities of GAM3513 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with IAPP.The function of IAPP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM347.

GAM3535 APPBP2 TCATTGGTTGCATAA TTTGATC Amyloid Beta Precursor Protein (cytoplasmic tail)- binding Protein 2 (APPBP2, Accession NM_006380.2) is a GAM3535 target gene. APPBP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APPBP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APPBP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3535 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3535 is therefore inhibition of APPBP2, a GAM3535 target gene which interacts with the basolateral sorting signal of amyloid precursor protein. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3535 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APPBP2.The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3593 APP TGTGCACAACATGCA GGTTTGT APP (Accession NM_000484.1) is a GAM3593 target gene. APP BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APP, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APP BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3593 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3593 is therefore inhibition of APP. Accordingly, utilities of GAM3593 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APP.

GAM3595 ADAM10 AGGCTGCAGTGTAGT GGCATGA A Disintegrin and Metalloproteinase Domain 10 (ADAM10, Accession NM_001110.1) is a GAM3595 target gene. ADAM10 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ADAM10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM10 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3595 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

A function of GAM3595 is therefore inhibition of ADAM10, a GAM3595 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3595 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM10.The function of ADAM10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to GAM1300.

GAM3595 A ADAM17 AGGCTGCAGTGTAGT A A GGCATGA A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, (ADAM17, Accession NM_003183.3) is another GAM3595 target gene. ADAM17 BINDING SITE1 through ADAM17 BINDING SITE3 are target binding sites found in untranslated regions of multiple transcripts of mRNA encoded by ADAM17, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ADAM17 BINDING SITE1 through ADAM17 BINDING SITE3, and secondary structure complementarity to the nucleotide sequence of GAM3595 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3595 is therefore inhibition of ADAM17, a GAM3595 target gene which is a member of ADAM family of zinc metalloproteases. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3595 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ADAM17.The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM317.

GAM3595 A FPRL1 AGGCTGCAGTGTAGT A A GGCATGA FPRL1 (Accession NM_001462.1) is another GAM3595 target gene. FPRL1 BINDING SITE1 and FPRL1 BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by FPRL1, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of FPRL1 BINDING SITE1 and FPRL1 BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3595 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3595 is therefore inhibition of FPRL1. Accordingly, utilities of GAM3595 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with FPRL1.

GAM3595 A HADH2 AGGCTGCAGTGTAGT A A GGCATGA Hydroxyacyl- Coenzyme A Dehydrogenase, Type II (HADH2, Accession NM_004493.1) is another GAM3595 target gene. HADH2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HADH2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HADH2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3595 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3595 is therefore inhibition of HADH2, a GAM3595 target gene which catalyzes the reversible oxidation of L- 3- hydroxyacyl- CoAs to form 3- ketoacyl- CoAs and binds intracellular amyloid- beta. and therefore is associated with

Alzheimer. Accordingly, utilities of GAM3595 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HADH2.The function of HADH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM1820.

GAM3595 NCKAP1 AGGCTGCAGTGTAGT NCKAP1 (Accession NM_013436.2) is another GAM3595 target gene. A A
GGCATGA NCKAP1 BINDING SITE is a target binding site found in the 5` untranslated region of mRNA encoded by NCKAP1, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of NCKAP1 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3595 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3595 is therefore inhibition of NCKAP1. Accordingly, utilities of GAM3595 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with NCKAP1.

GAM3595 PRND AGGCTGCAGTGTAGT Prion Protein 2 (dublet) (PRND, Accession NM_012409.1) is A A
GGCATGA another GAM3595 target gene. PRND BINDING SITE1 and PRND BINDING SITE2 are target binding sites found in untranslated regions of mRNA encoded by PRND, corresponding to target binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of PRND BINDING SITE1 and PRND BINDING SITE2, and secondary structure complementarity to the nucleotide sequence of GAM3595 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3595 is therefore inhibition of PRND, a GAM3595 target gene which is similar to prion protein PRNP. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3595 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with PRND.The function of PRND and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3605 ACE TTGTCAGAGGCTGGT Angiotensin I Converting Enzyme (peptidyl- dipeptidase A) 1 A A
AGGGTGT (ACE, Accession NM_152831.1) is a GAM3605 target gene. ACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by ACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3605 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3605 is therefore inhibition of ACE, a

GAM3605 target gene which Angiotensin I- converting enzyme (dipeptidyl carboxypeptidase 1). and therefore is associated with Alzheimer. Accordingly, utilities of GAM3605 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ACE.The function of ACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM44.

GAM3605 CTNND2 TTGTCAGAGGCTGGT AGGGTGT Catenin (cadherin- associated protein), Delta 2 (neural plakophilin- rel (CTNND2, Accession NM_001332.1) is another GAM3605 target gene. CTNND2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CTNND2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CTNND2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3605 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3605 is therefore inhibition of CTNND2, a GAM3605 target gene which interacts with presenilin 1 (PSEN1) and is a member of the plakoglobin/armadillo family. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3605 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CTNND2.The function of CTNND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM550.

GAM3605 DLST TTGTCAGAGGCTGGT AGGGTGT Dihydrolipoamide S- succinyltransferase (E2 component of 2- oxo- glutarat (DLST, Accession NM_001933.2) is another GAM3605 target gene. DLST BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by DLST, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of DLST BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3605 RNA are set forth in Tables 6 and 7, hereby incorporated herein. A A

Another function of GAM3605 is therefore inhibition of DLST, a GAM3605 target gene which catalyzes the oxidative decarboxylation of alpha- keto acids. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3605 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with DLST.The function of DLST and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM240.

GAM3605 SNCA TTGTCAGAGGCTGGT AGGGTGT SNCA (Accession NM_000345.2) is another GAM3605 target gene. SNCA BINDING SITE is a target binding site found in the 3` A A

untranslated region of multiple transcripts of mRNA encoded by SNCA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of SNCA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3605 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3605 is therefore inhibition of SNCA. Accordingly, utilities of GAM3605 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with SNCA.

GAM3605 APLP2 GCAGCTCCCTATTCC Amyloid Beta (A4) Precursor- like Protein 2 (APLP2, Accession B A
ATGACAG NM_001642.1) is another GAM3605 target gene. APLP2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by APLP2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of APLP2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3605 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3605 is therefore inhibition of APLP2, a GAM3605 target gene which may play a role in the regulation of hemostasis. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3605 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with APLP2.The function of APLP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM674.

GAM3605 HD GCAGCTCCCTATTCC HD (Accession NM_002111.3) is another GAM3605 target gene. HD B A
ATGACAG BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by HD, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of HD BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3605 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3605 is therefore inhibition of HD. Accordingly, utilities of GAM3605 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with HD.

GAM3630 MAPK10 ACTGGCACAGACATC Mitogen- activated Protein Kinase 10 (MAPK10, Accession A A
TGTCAAG NM_138981.1) is a GAM3630 target gene. MAPK10 BINDING SITE is a target binding site found in the 5` untranslated region of multiple transcripts of mRNA encoded by MAPK10, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MAPK10 BINDING SITE, and

secondary structure complementarity to the nucleotide sequence of GAM3630 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3630 is therefore inhibition of MAPK10, a GAM3630 target gene which is a members of the mitogen- activated protein kinase (MAPK) family that activate the Jun (see 165160) transcription factor. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3630 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MAPK10.The function of MAPK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM3630 MTNR1A ACTGGCACAGACATC Melatonin Receptor 1A (MTNR1A, Accession NM_005958.2) is A A

TGTCAAG another GAM3630 target gene. MTNR1A BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by MTNR1A, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of MTNR1A BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3630 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3630 is therefore inhibition of MTNR1A, a GAM3630 target gene which likely mediates the reproductive and circadian actions of melatonin. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3630 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with MTNR1A.The function of MTNR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM401.

GAM3640 ARHA GGGGGATCATTATAA Ras Homolog Gene Family, Member A (ARHA, Accession NM_001664.1) A A

AAATACT is a GAM3640 target gene. ARHA BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by ARHA, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of ARHA BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3640 is therefore inhibition of ARHA, a GAM3640 target gene which regulates remodeling of the actin cytoskeleton during cell morphogenesis and motility. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with ARHA.The function of ARHA and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM66.

GAM3640 BACE GGGGGATCATTATAA Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) A A

AAATACT is another GAM3640 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3640 is therefore inhibition of BACE, a GAM3640 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.

GAM3640 CASP3 GGGGGATCATTATAA Caspase 3, Apoptosis- related Cysteine Protease (CASP3, A A

AAATACT Accession NM_032991.1) is another GAM3640 target gene. CASP3 BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by CASP3, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CASP3 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3640 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3640 is therefore inhibition of CASP3, a GAM3640 target gene which is one apoptosis- related cysteine protease and is important for the initiation of apoptotic cell death. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CASP3.The function of CASP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM801.

GAM3640 CAV2 GGGGGATCATTATAA Caveolin 2 (CAV2, Accession NM_001233.2) is another GAM3640 A A

AAATACT target gene. CAV2 BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CAV2, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CAV2 BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3640 RNA are set forth in Tables 6 and 7, hereby

incorporated herein.

Another function of GAM3640 is therefore inhibition of CAV2, a GAM3640 target gene which may function as an accessory protein in conjunction with caveolin- 1and act as a scaffolding protein within caveolar membranes. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3640 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CAV2.The function of CAV2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM55.

GAM3666 CNTF AGCTGAGAAAGCGAA Ciliary Neurotrophic Factor (CNTF, Accession NM_000614.2) is a A A GAGGTGG GAM3666 target gene. CNTF BINDING SITE is a target binding site found in the 3` untranslated region of mRNA encoded by CNTF, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of CNTF BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3666 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

A function of GAM3666 is therefore inhibition of CNTF, a GAM3666 target gene which is a survival factor for various neuronal cell types. and therefore is associated with Alzheimer. Accordingly, utilities of GAM3666 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with CNTF.The function of CNTF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM175.

GAM3666 BACE CTACTTGTTCCTCTC Beta- site APP- cleaving Enzyme (BACE, Accession NM_012104.2) B A ACCTCAA is another GAM3666 target gene. BACE BINDING SITE is a target binding site found in the 3` untranslated region of multiple transcripts of mRNA encoded by BACE, corresponding to a target binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III of Fig.8. Nucleotide sequences of BACE BINDING SITE, and secondary structure complementarity to the nucleotide sequence of GAM3666 RNA are set forth in Tables 6 and 7, hereby incorporated herein.

Another function of GAM3666 is therefore inhibition of BACE, a GAM3666 target gene which is responsible for the proteolytic processing of the amyloid precursor protein and therefore is associated with Alzheimer. Accordingly, utilities of GAM3666 include diagnosis, prevention and treatment of Alzheimer, and of other diseases and clinical conditions associated with BACE.The function of BACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to GAM99.
